1 INTRODUCTION

1.1 Organization and Terms of Reference

Maryland Regulation of Water Supply, Sewage Disposal, and Solid Waste, COMAR 26.04.07, establishes the Maryland Department of the Environment (MDE) as the permitting authority for sanitary landfills within the state and the process for submittal, review, and approval of such permits. As described in COMAR 26.04.07.07, following the submittal and approval of a Phase I report and a request for permit, the second step to permit a new or expanded sanitary landfill is submitting a Phase II report describing the soils, geology, meteorology, and hydrogeology of the proposed site. In accordance with this requirement, this Phase II report has been prepared for a refuse disposal permit modification for the vertical expansion of Cell 9 with no increase in footprint at the Millersville Municipal Landfill and Resource Recovery Facility (MLFRRF), located at 389 Burns Crossing Road, Severn, Maryland. The MLFRRF operates under MDE refuse disposal permit number 2022-WMF-0240 (MDE 2022). This Phase II report is prepared by Geosyntec Consultants, Inc., (Geosyntec) on behalf of the Anne Arundel County Department of Public Works (the County), the owner and operator of MLFRRF.

Geosyntec submitted Phase I of the permit application (Phase I report) to MDE in October 2023. In November 2023, Geosyntec submitted a revised Phase I report (Geosyntec 2023) to MDE. As part of the Phase I process, MDE held a Public Informational Meeting at the Arundel High School (1001 Annapolis Road, Gambrills, Maryland 21054) on Thursday, May 23, 2024, at 5:30 p.m. On June 6, 2024, MDE notified the County that the Phase I report satisfied the minimum requirements under COMAR 26.04.07.06 such that the County could proceed with submission of the Phase II report, as described herein.

This Phase II report is organized in a manner consistent with the format and conditions of COMAR 26.04.07.07.

- Section 1 provides a Statement of Professional Qualifications as required under COMAR 26.04.07.07(B) and an overview description of existing conditions at the site.
- Section 2 explains the way this report will address and comply with the regulatory requirements of COMAR 26.04.07.07(C) for a Phase II report.
- Section 3 describes the previous investigative and monitoring programs used to characterize the site.
- Section 4 provides a detailed characterization of the site, including descriptions of climatic, topographic, geologic, and hydrogeologic conditions.
- Section 5 outlines the conceptual design for the proposed vertical expansion area that will be used as the basis for the design that will be submitted for approval by MDE under the Phase III report as required under COMAR 26.04.07.08.
- References are listed in Section 6.

1.2 Statement of Professional Qualifications

This Phase II report was prepared by Geosyntec of Columbia, Maryland, by Mr. Daniel Espinoza, Mr. Muaath Alsayyedahmad, and Mr. Ted Wilson and was reviewed by Mr. Mark Bauer and Ms. Meena Viswanath, PE (MD) in accordance with Geosyntec's internal review policy.

In compliance with COMAR 26.04.07.07(B), this Phase II report was prepared under the direction of and reviewed by Mr. Mark Bauer, a licensed Professional Geologist in Delaware (S4-0011428). Mr. Bauer has a bachelor's degree in geology from State University of New York - Oswego and has over 19 years of experience performing hydrogeologic investigations. Through his signature below, Mr. Bauer certifies that the information presented in this report is accurate and true to the best of his knowledge. This report was also reviewed and approved for submission to MDE by Ms. Meena Viswanath, PE, a licensed Professional Engineer in Maryland.

1.3 Overview of the Facility

1.3.1 Facility Location

MLFRRF is located on a 567.66-acre parcel of land at 389 Burns Crossing Road in Severn, Maryland, as shown in the area map provided in **Figure 1**. MLFRRF is owned and operated by Anne Arundel County Department of Public Works. MLFRRF began operating in 1975 and has 269 acres permitted for waste disposal.

1.3.2 Facility Description

MLFRRF consists of nine waste disposal cells (**Figure 2**). Cell 1-East, Cell 2, Cell 4, Cells 5 through 7 (henceforth referred to as Cell 567), and Cell 8 are all separate fill areas that have been closed and have received a final cover system that includes a geomembrane cap and landfill gas (LFG) collection system. Waste in Cell 3 and Cell 1-West was excavated and relocated into Cell 8 in 1994 and 1997, respectively.

Cell 9, as shown in **Figure 2**, is an 84-acre disposal area currently subdivided into five subcells (Subcells 9.1 through 9.5) and is currently the only remaining permitted cell available for waste disposal at MLFRRF. The Cell 9 design was first developed as part of the Phase II Permit Modification Application (Geosyntec 1989; included as **Attachment 1**) and the Phase III Permit Application (Geosyntec 1994) for Cell 9, prepared by Geosyntec and permitted by MDE. Several revisions to the Cell 9 disposal area were subsequently repermitted as part of the Subcell 9.1 project (SCS Engineering [SCS] 2014). Construction of Subcell 9.1 was completed in late 2016, and construction of Subcell 9.2 was completed in March 2021. Both are currently receiving waste. Subcell 9.3 is currently under construction.

LFG is being collected from Cells 1-East, 2, 4, 567, 8, and 9 at MLFRRF. The existing LFG collection system at the landfill consists of horizontal gas collection trenches, vertical gas extraction wells, transmission headers and lateral pipes, monitoring probes, condensate controls, blowers, and flares. Currently, LFG that is collected is being supplied to an on-site LFG-to-electricity plant that generates electricity under a long-term contract with the County. As a result, collected LFG is only flared when the LFG-to-energy plant is off-line.

The current topography in the vicinity of Cell 9 is based on an aerial survey conducted on January 2, 2024 (**Figure 3**). Cell 9 is located parallel to the southern property boundary and is the southern-most waste disposal cell. To the north of Cell 9 lie Joel Saline Way (a road), the Cell 9 stormwater management pond (Pond 9-2), Wells Branch (an intermittent stream), the other disposal cells, and the LFG infrastructure (LFG-to-energy plant and blower/flare station). To the west of Cell 9 lie the landfill facility entrance, residential recycling center, and various buildings. To the south and east of Cell 9 lie forested areas to the property boundary. The natural topography of the site in the vicinity of Cell 9 ranges from 88 to 230 feet above mean sea level as measured by the National Geodetic Vertical Datum of 1929 (ft-NGVD29), with the higher elevations near the southern property boundary and generally sloping down to the north.

Although all five subcells have been permitted as Cell 9, Subcells 9.1 and 9.2 are currently the only active subcells. Subcell 9.3 is under construction, and Subcells 9.4 and 9.5 have yet to be constructed. The northern half of the future Subcells 9.3 and 9.4 has previously been cleared of vegetation and developed as a soil borrow area, while the northeast corner of the future Subcell 9.5 has been cleared of vegetation and developed as a recycling area. As part of Subcell 9.3 construction, the remainder of Subcell 9.4 and the southern half of Subcell 9.5 are being cleared and developed as a soil stockpile and soil borrow area. The remaining northern portion of Subcell 9.5 is currently forested.

1.3.3 Proposed Vertical Expansion

As explained in the previous section, Cell 9 is currently the only active cell accepting waste at MLFRRF. The Cell 9 footprint covers approximately 84 acres and is being developed in phased subcells, with Subcells 9.1 and 9.2 currently constructed and accepting waste and Subcell 9.3 under construction. The current Cell 9 permitted disposal capacity is approximately 8.5 million cubic yards, while the currently permitted maximum landfill elevation at Cell 9 is 244 ft-NGVD29. The proposed vertical expansion will raise the maximum landfill elevation to 285 ft-NGVD29 as well as modify the geometry of the base grades and final cover grades, increasing the disposal capacity to approximately 13.5 million cubic yards. The landfill, which is intended to serve only the residents and businesses of Anne Arundel County, will continue to

accept residential and commercial solid waste (household refuse and waste from businesses, stores, and offices) and construction and demolition debris.

The increase in airspace from the proposed vertical expansion is anticipated to result from five design modifications:

- Steepening base grade interior side slopes on future subcells from 4 horizontal to 1 vertical (4H:1V) to 3H:1V
- Steepening final cover exterior side slopes from 3.5H:1V to 3H:1V
- Using tack-on stormwater diversion benches in place of incised benches along the exterior side slopes
- Increasing the landfill maximum elevation from 244 ft-NGVD29 to 285 ft-NGVD29
- Using an exposed geomembrane cover in place of the currently approved final capping system

Cell 9 is currently expected to run out of available permitted disposal capacity in 2048 (based on a fill rate of 140,000 ton per year and 1 percent [%] annual growth). Using the same metrics, the expansion will allow the landfill to operate and accept municipal solid waste until approximately 2060.

2 REQUIREMENTS FOR THE PHASE II REPORT

2.1 COMAR Requirements

COMAR 26.04.07.07(C) requires that a Phase II report include information on 12 specific issues in sufficient detail to permit a comprehensive review of a proposed project. In this section, each issue is reproduced in italic type, followed by a brief description of how and where that requirement is met and/or addressed in the remainder of this report. For ease of report review, a checklist is provided in **Table 1a**.

(1) *An up-to-date site-specific topographic map using a contour interval which is practical for that site. The following items shall be shown on the map: (a) Surface waters and natural drainage features; (b) 100-year flood plain; (c) Property lines; (d) On-site buildings and structures; (e) Forested and other vegetated areas; and (f) The location of any buried or overhead power transmission lines, utility pipelines, or storage tanks on the property.*

The topography of the proposed expansion area is described in **Section 4.2**. A site-specific topographic map showing these required features is provided as **Figure 3**. The Federal Emergency Management Agency (FEMA) flood map for the area is presented in **Figure 4** and shows that Cell 9 is not located within the 100-year floodplain.

(2) *A discussion of the geologic formations directly underlying and in close proximity to the site, the present and projected use of these formations as a source of ground water and minerals, and the hydrogeologic relationship between the formations.*

The geologic formations underlying the proposed expansion area and their hydrogeologic relationships are discussed in **Sections 4.3** and **4.4**, respectively. The regional and local geology and hydrogeology are shown in **Figures 5, 6,** and **7**.

(3) *A survey of all production wells within ½ mile of the site boundary. Each well shall be located on the topographic map and a table shall be developed which specifies all the available pertinent information such as well depth, screen type, productivity, materials encountered, and water level.*

A discussion of the groundwater production wells within 0.5 miles of MLFRRF property boundary is presented in **Section 4.4.5**. Specific production well data are presented in **Table 2**. Well locations are shown on the production well location map provided as **Figure 8**.

(4) *Ground water contour maps to show the occurrence and direction of ground water flow beneath the site superimposed on the current topographic map. Three separate ground water contour maps as specified below shall be constructed for each distinct water-bearing formation occurring within 50 feet of the anticipated lowest elevation of the refuse cell floor, using monthly ground water elevation data collected from piezometers on the site over a period of not less than 12 months, or derived using a hydrologic simulation or prediction technique approved by the Department. Three ground water contour maps shall be constructed from a set of: (a) Water elevations measured or predicted during the month that represents the most: (i) Elevated ground water condition, (ii) Depressed ground water condition; and (b) The highest observed or predicted ground water elevations.*

A site-specific hydrogeologic model has been developed based on historical investigation data and recent groundwater monitoring data reviewed for this Phase II report. The occurrence and direction of groundwater flow is discussed in **Section 4.4.3**. Contours of elevated and depressed groundwater conditions and highest observed groundwater elevations for the hydrostratigraphic unit encountered in the vicinity of Cell 9 are presented in **Figures 9, 10,** and **11**, respectively. Groundwater elevation data are tabulated in **Table 3**.

(5) *Geologic cross sections in sufficient detail, orientation, and number to clearly identify subsurface conditions at the site.*

A geologic cross section key map is shown in **Figure 12**, and geologic cross sections of the Cell 9 area are provided in **Figures 13** and **14**.

(6) *A bedrock map, except in the coastal plain outside the fall zone, to show the contours of the bedrock surface beneath the site.*

A bedrock map is not required because MLFRRF is in the coastal plain outside the fall zone, where the depth to bedrock is many thousands of feet.

(7) *An isopachous map to show the minimum thickness of soil and other unconsolidated sediments above the elevation of ground water as determined in §C(4), or bedrock as determined in §C(6), whichever is the higher.*

Based on the interpreted geology from the subsurface investigation, an isopachous map showing the thickness of soils above the groundwater table as determined in §C(4) is included as **Figure 15**. The figure shows the thickness of soils between the groundwater table and the proposed base of the liner system.

(8) *A discussion of the chemical quality of ground water in the aquifers beneath the site as determined in §C(2) of this regulation. The list of chemical parameters shall include pH,*

alkalinity, hardness, chloride, specific conductance, nitrate, chemical oxygen demand, arsenic, barium, cadmium, chromium, zinc, lead, mercury, the volatile priority pollutants, and any other pollutants specified by the Department.

Characterization of groundwater quality has been conducted by the County and its consultants since 1993. Groundwater quality around Cell 9 is discussed in **Section 4.4.4** and tabulated in **Tables 4** through **7**.

(9) *A discussion of the potential for the vertical and horizontal movement of pollutants into the waters of this State.*

The potential for pollution of State waters because of the proposed vertical expansion is very low, as discussed in **Section 4.5**.

(10) *The results of a fracture trace or aerial photographic lineament analysis (except in the coastal plain) which identifies the relationship between these features and the local ground water hydrology*.

MLFRRF is in the coastal plain, where the depth to bedrock is thousands of feet (i.e., near-surface faults and fractures are not present and bear no relationship with local groundwater hydrology). A fracture trace or aerial photographic lineament analysis is therefore not required.

(11) *Test boring logs, well completion reports, piezometric measurements, chemical and physical soil/sediment analyses, and all accompanying geotechnical analyses. All laboratory and field methodologies and procedures shall be included*.

Many geotechnical and hydrogeologic investigations have been conducted at MLFRRF in the vicinity of Cell 9. These investigations are discussed in **Section 3.2.1**. Geotechnical laboratory data are discussed in **Section 4.3.3**.

(12) *A preliminary conceptual design of the proposed municipal landfill based on the geotechnical information gathered in §C(1)-(11) of this regulation.*

Conceptual base grades and final grades for the proposed vertical expansion are presented in **Figures 16** and **17**, respectively. Details of the proposed liner system are shown on **Figure 18**. The way the landfill design will comply with the specific regulatory requirements of §C(12)(a) through §C(12)(c) is described in **Section 5**.

2.2 Siting Considerations 40 CFR 258

United States Environmental Protection Agency (USEPA) regulations contained in the Code of Federal Regulations (CFR) Title 40 – Protection of the Environment, Part 258 – Solid Waste Disposal Facility Criteria, Final Rule entitled "Criteria for Municipal Solid Waste Landfills" (i.e., 40 CFR 258) present the location restrictions for municipal solid waste landfills. The restrictions address both the potential effects that a municipal landfill may have on the surrounding environment and the effects that the environment may have on the performance of the landfill. The seven location restrictions of 40 CFR 258 that must be addressed are (i) airport safety, (ii) floodplains, (iii) wetlands, (iv) fault areas, (v) seismic impact zones, (vi) unstable areas, and (vii) habitat for rare, threatened, or endangered species. These restrictions are discussed in the remainder of this section.

Airport Safety: In 40 CFR 258.10, the proximity of landfills to airports is restricted to prevent creating a bird hazard to aircraft. Cell 9 is not located within 10,000 feet of any airport. As part of the Phase I Report, Geosyntec submitted seven online notifications to the Federal Aviation Administration (FAA) using FAA Form 7460-1 notifying FAA of the intention to vertically expand Cell 9 to a final elevation not to exceed 285 ft-NGVD29. These notifications were processed by FAA under Aeronautical Study Numbers 2023-AEA-13766-OE through 2023-AEA-13772-OE. On December 6, 2023, the FAA issued letters of "Determination of No Hazard to Air Navigation" for all seven points. These letters of determination were included in the Phase I Report.

Floodplains: Landfill units are restricted from being in an area inundated by the 100-year flood by 40 CFR 258.11. Cell 9 is outside of the 100-year floodplain and lies within an area with a minimal risk of flooding, as mapped by FEMA. The FEMA map for Cell 9 is presented as **Figure 4**. Cell 9 is outside the 1,000-foot buffer zone required by the State of Maryland's Critical Areas Law.

Wetlands: 40 CFR 258.12 governs the siting of landfills in wetlands. In November 2007, Gannett Fleming prepared a wetland identification and delineation report prior to construction of the initial Cell 9 support infrastructure. Gannett Fleming identified two wetlands and one intermittent stream (Wells Branch) within the study area. They found that a portion of the Cell 9 perimeter road and Pond 9-2 impinged on wetlands and the 25-foot wetland buffer. In January 2008, Gannett Fleming prepared a Joint Federal/State Application for the Alteration of Any Floodplain Waterway, Tidal, or Nontidal Wetland in Maryland. Pond 9-2 was constructed in 2011–2012. The 2007 wetland identification and delineation report and the 2008 application are included in **Appendix A**.

In October 2013, the Joint Federal/State Application was modified prior to construction of Subcell 9.1 and the borrow area to reflect the final design of Subcell 9.1 and in response to state agency comments. This modified application also included a summary of an alternatives analysis that was originally prepared in August 1994. The application was approved on September 10, 2014, by the Maryland Water Management Administration and on December 14, 2014, by the Baltimore District of the US Army Corps of Engineers. The design of wetlands mitigation efforts was approved on June 5, 2014, by the Maryland Water Management Administration. The modified application and all three approval letters, are included in **Appendix A**. Since no increase to the footprint of Cell 9 is included as a part of this permit application, there will be no new impacts to wetlands, and a new wetland study is not needed for this permit application.

Fault Areas: In accordance with the requirements of 40 CFR 258.13, new landfill units shall not be located within 200 feet of a fault that has had displacement in Holocene time. Based on "*Preliminary Map of Young Faults in the United States as a Guide to Possible Fault Activity"* (Howard et al. 1978), there are no faults known to have had displacement in Holocene time in the entire state of Maryland.

Seismic Impact Zones: According to 40 CFR 258.14, a seismic impact zone is identified as an area with a 10% or greater probability that the maximum horizontal acceleration in lithified earth material, expressed as a percentage of the earth's gravitational pull (g), will exceed 0.10g in 250 years. The maximum horizontal acceleration in bedrock for the landfill is estimated to be between 0.06g and 0.08g, based on the United States Geological Survey (USGS) seismic hazard

map shown in **Figure 19** with contours of peak acceleration with 2% probability of exceedance in 50 years. A 2% probability of exceedance in 50 years is approximately equivalent to a 10% probability of exceedance in 250 years. Cell 9 is therefore not considered to be in a seismic impact zone.

Unstable Areas: Landfill units are restricted by 40 CFR 258.15 from being in unstable areas (e.g., poor foundation conditions, areas susceptible to mass movements, and karst terranes). Based on recent and historical subsurface explorations performed at MLFRRF, no unstable areas have been identified that will be impacted by this vertical expansion.

Rare, Threatened, or Endangered Species: 40 CFR 258.12 requires that the proposed development area shall not jeopardize the continued existence of rare, threatened, or endangered species. As this is a vertical expansion, there will be no change to the footprint of Cell 9. This expansion will not encroach on any territory or wetland that has not already been permitted in the past.

2.3 MDE Checklist

In addition to the regulatory requirements presented in Sections 2.1 and 2.2, MDE has provided informal guidance regarding the information that is expected to be included in Phase II Permit Application documents. This information was provided in the form of a checklist, which is reproduced in **Table 1b**, along with the location in this permit application where the information is provided.

3 INVESTIGATION AND MONITORING

3.1 Overview and Purpose

This section describes the types of soils and groundwater conditions observed during field investigations conducted in the vicinity of Cell 9. Subsurface investigations that have been conducted to evaluate the geologic, hydrogeologic, and geotechnical conditions in the vicinity of Cell 9 are discussed to provide a basis for planning, designing, operating, and monitoring Cell 9. Subsurface investigations that are described in this section include drilling, soil sample collection, and laboratory tests that have been performed to explore the geotechnical and geologic conditions at Cell 9. Installation and development of monitoring wells to investigate the groundwater conditions beneath Cell 9, as well as groundwater sampling and analytical testing, are also discussed herein.

3.2 Subsurface Investigations

3.2.1 Historical Facility Investigations

Many field investigations have been completed in the vicinity of Cell 9 to assess the characteristics of subsurface soils. A summary of notable field investigations is presented below in chronological order. All boring logs are presented in **Appendix B**.

<u>Green Associates, Inc./Century Engineering, Inc. (1969)</u>: In 1969, Green Associates (which later became Century Engineering, Inc.) conducted a geotechnical exploration and advanced nine borings (X-series) at MLFRRF, of which one 25-foot-deep boring (X-4) was in the vicinity of

Cell 9. The boring showed primarily silty and clayey sands at the ground surface, underlain by low plasticity clays and silts. The location of the boring is shown in **Figure 20**, and the boring log is included in **Appendix B.1**.

Green Associates, Inc./Century Engineering, Inc. (1971): Green Associates conducted a geotechnical exploration and advanced 11 borings (B-series) at MLFRRF, of which 2 borings (25 feet deep and 69.4 feet deep) were in the vicinity of Cell 9. The borings showed primarily silty and clayey sands at the ground surface, underlain by low-plasticity clays and silts. The locations of the borings are shown in **Figure 20**, and the boring logs are included in **Appendix B.2.**

Green Associates, Inc./Century Engineering, Inc. (1972): Green Associates conducted a geotechnical exploration and advanced 34 borings (F-series) at MLFRRF, of which 11 borings with depths ranging from 16.5 to 51.5 feet were in the vicinity of Cell 9. The borings showed primarily silty and clayey sands at the ground surface, underlain by low-plasticity clays and silts. The locations of the borings are shown in **Figure 20**, and the boring logs are included in **Appendix B.3.**

Geoservices Inc./Geosyntec Consultants, Inc. and others (1975 to 2012): Geoservices (which later became Geosyntec Consultants) installed a series of groundwater monitoring wells (TW-series) between 1989 and 2012 at MLFRRF to supplement a series of groundwater monitoring wells (TW-series) that had previously been installed in 1975 by others. Three of these wells (TW-2, TW-3, and TW-4; all installed in 1975), ranging in depth from 100 to 180 feet, are in the vicinity of Cell 9. The borings showed primarily silty and clayey sands at the ground surface, underlain by low-plasticity clays and silts. The locations of the borings are shown in **Figure 20**, and the boring logs are included in **Appendix B.4.**

Geoservices Inc./Geosyntec Consultants, Inc. and Gershman, Brickner and Bratton, Inc. (1989): Geoservices et al. conducted a field investigation as part of the Phase II Permit Modification Application for the redesign of Cells 8 and 9 at MLFRRF. The field investigation included advancing 12 geotechnical borings (G-series), of which 3 borings (G-1, G-2, and G-3), ranging in depth from 45 to 180 feet, were in the vicinity of Cell 9. The borings were consistent with others and showed primarily silty and clayey sands at the ground surface, underlain by low-plasticity clays and silts. The locations of the borings are shown in **Figure 20**, and the boring logs are included in **Appendix B.5.**

SCS (2011): SCS conducted a field investigation to support the design and construction of Subcell 9.1. The field investigation included advancing six geotechnical borings (SCS-1 through SCS-6). The borings were advanced to depths ranging between 17 and 55 feet. The borings were consistent with others and showed primarily silty and clayey sands at the ground surface, underlain by low-plasticity clays and silts. The locations of the boring are shown in **Figure 20**, and the boring logs are included in **Appendix B.6.**

Geosyntec (2017): Geosyntec conducted a field investigation to support the design and construction of Subcell 9.2. The field investigation included advancing five geotechnical borings (B-1 through B-5) and eight temporary piezometers (P-1 through P-8). Two of the borings were collocated with piezometers. The borings were advanced to depths ranging between 60 and 75 feet. The borings were consistent with others and showed primarily silty and clayey sands at the

ground surface, underlain by low-plasticity clays and silts. The locations of the borings are shown in **Figure 20**, and the boring logs are included in **Appendix B.7.**

SCS (2017): SCS completed a southern boundary groundwater investigation at MLFRRF that included advancing nine new monitoring wells, of which seven (TW-series, Well N, and Well W) were in the vicinity of Subcells 9.4 and 9.5. The wells were advanced to depths ranging between 132 and 328 feet. The locations of the borings are shown in **Figure 20**, and the boring logs are included in **Appendix B.8.**

Froehling & Robertson, Inc. (2022): Froehling & Robertson conducted a geotechnical investigation at MLFRRF in support of the West County Road Ops Yard project. During this investigation, 26 borings were advanced, of which 2 (B-11 and B-12), ranging in depth from 30 to 40 feet, were in the vicinity of Cell 9. All borings encountered a silty sand, occasionally underlain by a sandy silt. The locations of the borings are shown in **Figure 20**, and the boring logs are included in **Appendix B.9.**

Geosyntec (2022): Geosyntec conducted a field investigation in support of the design and construction of Subcell 9.3. The field investigation consisted of seven geotechnical borings (B-1 through B-7), six temporary standpipe piezometers (P1 through P6), and four test pits (TP-1 through TP-4) within the footprint of Subcell 9.3, four geotechnical borings (B4-1 through B4-4) within the footprint of Subcell 9.4, and five geotechnical borings (B5-1 through B5-5) within the footprint of Subcell 9.5. The borings were advanced to depths varying from 25 to 88.5 feet. The locations of the boring are shown in **Figure 20**, and the boring logs are included in **Appendix B.10.**

According to the site investigations and laboratory tests, the subsurface at Cell 9 consists of up to 70 feet of sand (Sand I; Magothy Formation), underlain by approximately 10 to 50 feet of clay (Clay I; Upper Patapsco Formation), which is underlain by another sand layer (Sand II; Upper Patapsco Formation). The Sand I layer primarily consists of an orange-brown to tan, poorly graded sand with interbedded gravel, silt, and clay, while Clay I is a reddish-brown to grayish-brown lean clay with purple staining. Under Sand II is up to 80 feet of clay (Clay II; Lower Patapsco Formation), which is underlain by another sand layer (Sand III; Lower Patapsco Formation).

3.2.2 Groundwater Monitoring

Groundwater monitoring at the existing MLFRRF, including monthly groundwater level measurements and semiannual groundwater quality monitoring, is consistent with the monitoring requirements detailed in the MDE approved Environmental Monitoring Plan (EMP) (Environmental Resources Management [ERM] 2009) and MDE refuse disposal permit number 2022-WMF-0240.

3.2.2.1 Groundwater Level Measurements

Monthly groundwater level measurements at MLFRRF are collected by the ARM Group, LLC, (ARM) of Columbia, Maryland. Depth to groundwater level for each monitoring well and piezometer were measured to the nearest 0.01 inch using an electronic water level meter. **Table 3** presents the monthly groundwater elevation at each location from January 2022 to December 2023. Monitoring well locations are shown on **Figure 21**. The groundwater measurements were

used in the preparation of the elevated, depressed, and highest observed groundwater condition maps for the hydrostratigraphic unit (surficial aquifer) encountered in the vicinity of Cell 9. A discussion of the groundwater elevations and flow is presented in **Section 4.4.3**.

3.2.2.2 Groundwater Sampling

Six semiannual groundwater monitoring events were completed by ARM during the spring and fall of 2021 through 2023. Groundwater samples were collected from 22 regulated on-site monitoring wells (Subtitle D), 15 regulated on-site monitoring wells (COMAR), 13 on-site nonregulated monitoring wells[1], and 12 off-site monitoring wells. Copies of the semiannual monitoring reports from the spring of 2021 through the fall of 2023 are included as **Appendix C.**

4 CELL 9 AREA CHARACTERIZATION

4.1 Climate

Anne Arundel County has a temperate humid climate with warm summers and relatively mild winters. Temperatures in the county are heavily influenced by the moderating effects of the Chesapeake Bay and other nearby water bodies.

According to the National Oceanic and Atmospheric Administration National Weather Service, in the last 10 years (2013 to 2023), average temperatures have varied from approximately 80 degrees Fahrenheit in July and August to approximately 35 degrees Fahrenheit in January and February. Average precipitation is evenly distributed throughout the year. The average annual precipitation has been approximately 48 inches with an average monthly rainfall of 6 inches in the wettest months (June and July) and 3 inches in the winter months. Average annual snowfall has been about 3 inches, although this has varied significantly with some years recording no snowfall and others recording more snowfall.

4.2 Topography

Natural topography in Anne Arundel County consists of low rolling hills in the western portion of the county, which gradually become flatter from west to east. The current topography in the vicinity of MLFRRF is based on an aerial survey conducted on January 2, 2024 (**Figure 3**). Cell 9 is located parallel to the southern property boundary and is the southern-most waste disposal cell.

Based on the USGS topographic map for the area (**Figure 1**) and various site inspections, no springs, seeps, rock outcrops, or sinkholes are present on or near Cell 9. There are wooded areas surrounding MLFRRF on every side, and there is an intermittent stream (Wells Branch) running north of Cell 9 and south of Cell 8 and Cell 567 that is a tributary of the Severn Run River.

---

[1] The groundwater monitoring program includes 13 on-site nonregulated monitoring wells during the spring monitoring event. Six of those 13 monitoring wells are sampled on an annual basis during the spring event. Seven nonregulated monitoring wells are also sampled during the fall monitoring event.

4.3 Geologic Condition

4.3.1 Regional and Local Geology

MLFRRF is in the Coastal Plain Physiographic Province about 10 miles east of the fall zone (**Figure 5**). Anne Arundel County is underlain by a southeastward thickening wedge of unconsolidated sediments overlying consolidated crystalline basement rocks of Precambrian or Early Cambrian age. The unconsolidated sediments consist of stratified layers of sand, gravel, silt, and clay. The unconsolidated sediment wedge thins to a few tens of feet near the fall zone to the northwest and is approximately 2,000 feet thick in the southeastern part of the county.

The Potomac Group comprises the entire thickness of unconsolidated sediments in the northern part of the county. It is overlapped by younger deposits ranging in age from Late Cretaceous to Holocene in the central part of the county (**Figure 6**). The stratigraphy of the Potomac Group is very complex. Formations of the group were deposited in fluvial and lacustrine environments. Sand, silt, and clay layers are commonly limited in areal extent. Sand lenses 25 feet thick at a specific location have been found to be thicker, thinner, or absent at distances of 25 to 100 feet from that location (Mack and Achmad 1986).

The Potomac Group comprises three separate formations in Anne Arundel County; these are, from the base upward, the Patuxent Formation, the Arundel Clay, and the Patapsco Formation. The Patapsco Formation can be regionally divided into an upper and lower unit each consisting of a clay overlying a predominantly sand sequence. The Patapsco Formation includes all the lithologies from the base of the overlying upper Cretaceous Magothy Formation to the top of the underlying Arundel Clay. The total thickness of the Patapsco Formation in Anne Arundel County is approximately 500 feet (Mack and Achmad, 1986) and dips toward the southeast.

4.3.2 Geology

Surface geologic mapping in the vicinity of MLFRRF (see **Figure 6**) indicates the predominance of the silt-clay facies of the Potomac Group in the northeastern part of MLFRRF and the sand-gravel facies of the Potomac Group in the central portion of MLFRRF, including in the vicinity of Cell 9. The Magothy Formation, a predominantly sandy unit, outcrops along the southern boundary of MLFRRF just north of Dicus Mill Road and in the vicinity of Cell 9. Ferruginous cementation is common in the fluvial facies of the Magothy Formation. Blocks of ironstone conglomerate outcrop in this area.

Groundwater studies by Mack (1962) and Mack and Achmad (1986) suggest that the silt-clay facies of the Potomac Group at MLFRRF is part of a clay confining layer separating the overlying Magothy Formation from the underlying upper Patapsco Formation (**Figure 7**). The discontinuous silt clay facies (upper confining layer) at MLFRRF occurs at the ground surface under Cells 1 and 567 and at or near the ground surface under Cell 4. The sand-gravel facies of the Potomac Group occurs at the center of MLFRRF, roughly paralleling the existing surface drainage; this facies probably represents an old stream channel. The southern half of MLFRRF is capped by the sands of the Magothy Formation. Sand lenses occur within the silt-clay facies (i.e., within the upper confining layer) underlying the entire MLFRRF.

Historical boring and monitoring well installation logs are included as **Appendix B**. **Figure 12** presents a plan view showing the locations of the geologic sections (**Figure 13** and **14**). The geologic sections were developed using the site subsurface investigation boring logs discussed in **Section 3.2.1**.

4.3.3 Soil Property Testing

Many field investigation programs have been completed in the vicinity of Cell 9 to assess the soil properties, as discussion in **Section 3.2.1**. A summary of notable soil property testing performed during the investigations is presented below in chronological order and are shown in **Table 8.**

Geoservices Inc./Geosyntec Consultants, Inc. and Gershman, Brickner and Bratton, Inc. (1989): As part of the 1989 field investigation described in **Section 3.2.1**, laboratory testing was performed on selected disturbed soil samples. This testing included particle size analysis (ASTM International [ASTM] D422), water content (ASTM D2216), soil classification (ASTM D2487), and Atterberg Limits (ASTM D4318). A summary of results of the laboratory tests is presented in **Table 8.** The laboratory test data are presented in **Appendix D**.

Geosyntec (2015): During the construction of Subcell 9.1, the contractor conducted prequalification testing on 2 samples from on-site stockpiled clay material that was excavated from the Cell 9 footprint. These tests were done to ensure that the clay material would be acceptable for use as subbase. Laboratory testing was performed by Engineering Consulting Services (ECS) and Hillis-Carnes. The tests included hydraulic conductivity (ASTM D5084), particle size analysis (ASTM D422), soil classification (ASTM D2487), water content (ASTM D2216), Standard Proctor (ASTM D698-12), and Atterberg limits (ASTM D4318). A summary of results of the laboratory tests is presented in **Table 8.** The laboratory test data are presented in **Appendix D**.

Geosyntec (2019): Geosyntec conducted a subsurface investigation to characterize soil properties within the footprint of Subcell 9.2, as discussed in **Section 3.2.1**. Geosyntec conducted 10 laboratory tests on samples collected from borings and test pits. Laboratory testing was performed by Hillis-Carnes Engineering Associates, Inc. The tests included hydraulic conductivity (ASTM D5084 and ASTM D2434), particle size analysis (ASTM D422), soil classification (ASTM D2487), water content (ASTM D2216), Standard Proctor (ASTM D698-12), and Atterberg limits (ASTM D4318). A summary of results of the laboratory tests is presented in **Table 8.** The laboratory test data are presented in **Appendix D**.

SCS (2020): While performing construction quality assurance during the construction of Subcell 9.2, SCS conducted conformance testing on 12 samples from on-site stockpiled clay material and structural fill that was excavated from the Cell 9 footprint. These tests were done to ensure that the clay material would be acceptable for use as subbase and the structural fill material would be acceptable for use as structural fill. Laboratory testing was performed by the Robert B. Balter Company. This testing included particle size analysis (ASTM D422), soil classification (ASTM D2487), water content (ASTM D2216), Standard Proctor (ASTM D698-12), and Atterberg limits (ASTM D4318). A summary of results of the laboratory tests is presented in **Table 8.** The laboratory test data are presented in **Appendix D**.

Geosyntec (2023): Geosyntec conducted a subsurface investigation to characterize soil properties within the footprint of Subcell 9.2, as discussed in **Section 3.2.1**. Geosyntec conducted eight

laboratory tests on samples taken from borings and test pits. Laboratory testing was performed by Hillis-Carnes Engineering Associates, Inc., on all eight samples. The tests included are hydraulic conductivity (ASTM D5084), particle size analysis (ASTM D422), soil classification (ASTM D2487), water content (ASTM D2216), Standard Proctor (ASTM D698-12), and Atterberg limits (ASTM D4318). A summary of results of the laboratory tests is presented in **Table 8.** The laboratory test data are presented in **Appendix D**.

4.4 Groundwater Conditions

4.4.1 Regional and Local Hydrogeology

As discussed in **Section 4.3.1**, MLFRRF is in the Coastal Plain Physiographic Province, which is characterized by unconsolidated sediments consisting of stratified layers of sand, gravel, silt, and clay. The sand and gravel strata comprise the major water-bearing aquifers of the county, as shown on the hydrologic cross section (**Figure 7**). Within the county, the slope or dip of the aquifers vary. The deepest aquifer, the Patuxent Formation, dips to the southeast at 85 to 90 feet per mile, whereas the shallowest aquifer, the upper Patapsco, dips to the southeast at only 15 to 20 feet per mile.

The Potomac Group contains three distinct aquifers in Anne Arundel County: the Patuxent, lower Patapsco, and upper Patapsco. All three aquifers are confined, except in the outcrop areas where water table or unconfined conditions exist. Confining layers separate the aquifers in most places. Water level records from clusters of wells that tap the different aquifers indicate that the sands are hydrologically separated from one another. The water level records show that pumping water from one of the aquifers at a specific site commonly has no immediate effect on water levels in the other aquifers (Mack and Achmad 1986).

The Magothy Formation overlies the Potomac Group. According to Mack (1962), this aquifer is hydrologically connected in varying degrees with the underlying Patapsco aquifer. The Magothy Formation dips to the southeast at about 30 feet per mile and is used for water supply in the Annapolis area.

4.4.2 Hydrogeology

There are several water-bearing zones beneath Cell 9. The uppermost zone (Sand I; Magothy Formation) is in the fluvial sands of the Magothy Formation. Groundwater in this zone is unconfined and perched. This water-bearing zone is restricted to the southern and southwestern boundaries of MLFRRF, north of Dicus Mill Road, and along Burns Crossing Road, respectively. During all or part of the year, this zone may be dry in some areas. Most of Sand I has been or will be excavated and removed as part of the construction of Cell 9. Small portions of Sand I remain adjacent to Cell 9.

A second minor water-bearing zone occurs in a shallow sand zone confined within the silt-clay facies (Clay I; Upper Patapsco Formation) described by Glaser (1976), which is the same as the confining layer described by Mack and Achmad (1986) that separates the overlying Magothy Formation from the underlying upper Patapsco. The shallow sand zone in the silt-clay facies has also been described by Pittman (1982). In the southern part of MLFRRF, this sand zone may be either unconfined or confined and is recharged directly from precipitation or leakage from the

overlying perched aquifer. North of the drainage valley that cuts through the central area of MLFRRF, water levels in the shallow sand zone are similar to those in a deeper sand zone. Both sand zones have been described by Pittman (1982), suggesting some hydrologic interconnection.

The third water-bearing zone (Sand II; Upper Patapsco Formation) is the deep sand zone described by Pittman (1982). This sand zone is located approximately 25 feet below the shallow zone in the southern half of MLFRRF and below the outcropping silt-clay facies in the northern half of MLFRRF. The potentiometric surface for this zone (see **Figures 8, 9,** and **10**) indicates regional easterly flow with component directions to the north and south. Groundwater in this zone is either semiconfined or confined. The hydrostatic heads in this water-bearing zone are lower than the perched or shallow zones, indicating the potential for recharge by leakage from the overlying zones.

Below Sand II (Upper Patapsco Formation) is Sand III (Lower Patapsco Formation), which is confined by approximately 75 feet of clay. Because the bottom elevation of the Cell 9 liner system is greater than 50 feet from Sand III (Lower Patapsco Formation), it is not discussed in this section but is shown on the cross sections and discussed in historical investigations.

Groundwater monitoring wells used to develop the potentiometric surface are shown on **Figure 21**. As required in COMAR 26.04.07.07.C(4), the highest ground water elevations measured in monitoring wells installed in Sand II (Upper Patapsco Formation) for Cell 9 are shown on **Figure 11**. The groundwater elevations in **Figure 11** were considered in the redesign of the base grades in Cell 9.4 and 9.5 so that they meet the 3-foot minimum groundwater separation requirements of COMAR 26.04.07.07.C(l2)(b).

4.4.3 Groundwater Elevations and Flow

As discussed in **Section 3.2.2**, groundwater levels were measured monthly in monitoring wells and piezometers located in the vicinity of Cell 9 from January 2022 to November 2023. For the purposes of this Phase II report, only monitoring wells installed in Sand II (Upper Patapsco Formation) were used to evaluate groundwater elevations and flow direction. Specifically, the data collected from following monitoring wells were used: MW-P417, MW-P440, MW-P9, RW-P441, RW-P584, TW-01, TW-10A, TW-11A, TW-12, TW-13, TW-14, TW-15B, TW-16, TW-17, TW-18, TW-19, TW-02A, TW-20R, TW-21A, TW-22B, TW-24, TW-25, TW-25A, TW-29, TW-32, TW-3, TW-30, TW-04, TW-05, TW-06, TW-07A, TW-08, and TW-09C. Monitoring locations are shown on **Figure 21**.

A summary of calculated groundwater elevations and well construction details are provided in **Tables 3** and **9**, respectively. Those data were used to develop contour maps showing elevated, depressed, and highest observed groundwater elevations for the Sand II aquifer, which are provided as **Figures 9** through **11**. As previously discussed, only contour maps showing elevated, depressed, and highest observed groundwater elevations for the surficial aquifer are required per COMAR 26.04.07.07(C).

According to the monthly groundwater elevations, monitoring variations in any given month ranged from 1.73 feet at monitoring well TW-3A to 37.61 feet at monitoring well TW-5A.

Under the elevated groundwater conditions (**Figure 9**), which were observed in April 2022, the groundwater elevations ranged from a high of 117.63 ft-NGVD29 at TW-32 to a low of 57.79

ft-NGVD29 at RW-P584. The hydraulic gradient between TW-32 and TW-2A in the vicinity of Cell 9 was estimated at approximately 0.009 feet per foot (ft/ft) in Sand II.

Under the depressed groundwater conditions (**Figure 10**), which were observed in November 2023, the groundwater elevations ranged from a high of 116.08 ft-NGVD29 at TW-22B to a low of 56.41 ft-NGVD29 at RW-P584. The hydraulic gradient between TW-32 and TW-2A in the vicinity of Cell 9 was estimated at approximately 0.009 ft/ft in Sand II.

4.4.4 Groundwater Quality

As described in the sections above, MLFRRF and the surrounding region are underlain by alternating units of permeable silty sand units (aquifers) and nonpermeable clay units (aquitards). The permeable nature of the surficial aquifer makes it susceptible to groundwater contamination from infiltration of precipitation through contaminated material. Additionally, aquifers separated from the surficial aquifer by aquitards can be impacted by the infiltration if the aquitard has been excavated. At Cell 9, Clay I (Upper Patapsco Formation) has been partially removed, exposing Sand II (Upper Patapsco Formation) to the surficial aquifer. Below Sand II (Upper Patapsco Formation) is Clay II (Lower Patapsco Formation), which is intact and serves as the aquitard beneath the Site. As reported in the MLFRRF groundwater monitoring reports, groundwater quality below Clay II, Zone 4, is generally good and not impacted by MLFRRF.

As summarized in **Section 3.2.2**, ARM completed six semiannual groundwater monitoring events to evaluate baseline groundwater quality around Cell 9 during the spring and fall of 2021 through 2023. Groundwater samples were collected from 22 regulated on-site monitoring wells (Subtitle D), 15 regulated on-site monitoring wells (COMAR), 13 on-site nonregulated monitoring wells,[2] and 12 off-site monitoring wells, in accordance with the EMP (ERM 2009).

For the purposes of this Phase II report, only monitoring wells installed in Sand II (Upper Patapsco Formation) and Sand III (Lower Patapsco Formation) in the vicinity of Cell 9 were used to evaluate groundwater quality. Specifically, data collected from monitoring wells TW-01, TW-02, TW-02A, TW-03, TW-03A, TW-04, TW-05, TW-10A, TW-19, TW-20R, TW-21A, TW-26R, TW-29, and TW-30 were used to evaluate groundwater quality around Cell 9.

Groundwater analytical results for the above-referenced monitoring wells are presented in **Table 4** through **7**. A copy of the laboratory reports and accompanying chain-of-custody documentation are provided in the semiannual groundwater monitoring reports included as **Appendix C**. A discussion of the findings is presented in the sections below.

4.4.4.1 Volatile Organic Compounds and Semivolatile Organic Compounds

As shown in **Table 4,** only 11 volatile organic compounds (VOCs) were detected in groundwater at the monitoring wells in the vicinity of Cell 9 during at least one of the six semiannual

[2] The groundwater monitoring program includes 13 on-site non-regulated monitoring wells during the spring monitoring event. Six of those 13 monitoring wells are sampled on an annual basis during the spring event. Seven non-regulated monitoring wells are also sampled during the fall monitoring event.

sampling events completed. The VOC compounds detected were 1,1-dichloroethane, cis-1,2-dichloroethene, chloroform, dichlorodifluoromethane, dichlorofluoromethane, methylene chloride, methyl tert-butyl ether (MTBE), tetrachloroethene, trichloroethene, trichlorofluoromethane, and vinyl chloride. The VOC concentrations were relatively low, and only one detection of 1,1-dichloroethane at a concentration of 3.0 micrograms per liter (µg/L) exceeded the groundwater protection standard (GWPS)[3] of 2.8 µg/L in monitoring well TW-04. Repeated detections for the same constituent occurred as follows:

- 1,1-Dichloroethane was detected in monitoring wells TW-01, TW-04, TW-05, TW-19, and TW-29. Detected concentrations ranged from 0.8J (estimated) to 3.0 µg/L. The GWPS for 1,1-dichloroethane is 2.8 µg/L.
- Chloroform was detected in monitoring well TW-01, TW-02, TW-03, TW-05, TW-10A, TW-19, TW-21A, TW-29, and TW-30. Detected concentrations ranged from 0.113J to 0.755J µg/L. The GWPS for chloroform is 80 µg/L.
- cis-1,2-Dichloroethene was detected in monitoring wells TW-01, TW-04, TW-05, TW-19, and TW-29. Detected concentrations ranged from 0.4J to 1.1 µg/L. The GWPS for cis-1,2-dichloroethene is 70 µg/L.
- Dichlorodifluoromethane was detected in monitoring wells TW-01, TW-2A, TW-04, TW-05, and TW-29. Detected concentrations ranged from 0.8J to 13.3 µg/L. The GWPS for dichlorodifluoromethane is 4,000 µg/L.
- Dichlorofluoromethane was detected in monitoring wells TW-01, TW-2A, TW-04, TW-05, TW-19, and TW-29. Detected concentrations ranged from 0.344J to 4.77 J µg/L. There is no GWPS for dichlorofluoromethane.
- Methylene chloride was detected in monitoring wells TW-01, TW-05, TW-19, TW-20R, and TW-29. Detected concentrations ranged from 0.46JB to 0.653JB µg/L. The GWPS for methylene chloride is 5 µg/L. The detected concentrations were all estimated, and "B" flagged, which indicates the constituent was measured in the laboratory blanks.
- MTBE was detected in monitoring wells TW-01 and TW-29. Detected concentrations ranged from 0.274J to 0.6 J µg/L. The GWPS for MTBE is 2 µg/L.
- Tetrachloroethene was detected in monitoring wells TW-01, TW-19, and TW-29. Detected concentrations ranged from 0.5J to 1.36 µg/L. The GWPS for tetrachloroethene is 5 µg/L.
- Trichloroethene was detected in monitoring wells TW-01 and TW-29. Detected concentrations ranged from 0.326J to 0.9J µg/L. The GWPS for trichloroethene is 5 µg/L.

[3] Groundwater protection standards listed in this report are based on MDE (2018).

- Trichlorofluoromethane was only detected once in monitoring well TW-29 at a concentration of 0.277 J µg/L. The GWPS for trichlorofluoromethane is 6,000 µg/L.

- Vinyl chloride was only detected once in monitoring well TW-03A at a concentration of 0.278 J µg/L. The GWPS for trichlorofluoromethane is 2 µg/L.

VOC concentrations are summarized in **Table 4**.

SVOCs were only sampled from monitoring well TW-26R. No SVOCs were detected in monitoring well TW-26R during the six semiannual sampling events completed at the proposed vertical expansion area. SVOC results are summarized in **Table 5**.

Given the fact that many of the detected VOCs were measured in the upgradient monitoring wells (TW-01, TW-02, TW-02A, TW-03, TW-3A, and TW-30) and the low concentration of the detected VOCs, the source of the VOC detections is likely not from landfill operations in the active portion of Cell 9.

4.4.4.2 Metals

As summarized on **Table 6**, several metals were detected in groundwater samples collected during the six semiannual sampling events completed in the vicinity of Cell 9, but only iron, manganese, and lead were detected above their respective GWPS. There was one lead exceedance at TW-29 (downgradient monitoring well) during the fall 2022 monitoring event. This was a first-time exceedance, and MDE was notified. When verification resampling was conducted at TW-29 to confirm the detection, the concentration of lead in TW-29 was below detection limits. The initial detection was therefore deemed invalid.

Iron was detected in exceedance of the GWPS (1.4 milligrams per liter [mg/L]) at TW-01, TW-02, TW-02A, TW-03, TW-03A, TW-04, and TW-05 during all six sampling events. Manganese was detected above the GWPS of 0.043 mg/L at downgradient monitoring wells TW-04 and TW-05; at upgradient monitoring wells TW-01, TW-02, TW-02A, TW-03, and TW-03A; and at side-gradient monitoring well TW-10A during each monitoring event. Side-gradient monitoring well TW-21A also had manganese detected above the GWPS during two of six monitoring events.

Given the consistency of the concentrations and location of the exceedances (upgradient, downgradient, and side-gradient), the sampling results suggests that iron and manganese concentrations are naturally occurring and not thought to be a result of a release from the facility waste disposal area.

4.4.4.3 General Chemistry

General chemistry analyses results are summarized in **Table 7**. Several of those constituents, including alkalinity, ammonia, chloride, nitrate, specific conductivity (lab), sulfate, and total dissolved solids (TDS), are considered leachate indicator parameters. Elevated concentrations of these analytes can be indicative of leachate impacts in groundwater. General chemistry results were similar to background groundwater quality at the MLFRRF and do not represent a significant groundwater quality concern. A discussion of the frequency of detection and

distribution for the indicator parameters in groundwater samples collected during the six semiannual sampling events completed in the vicinity of Cell 9 is provided below.

- Alkalinity was measured at all monitoring wells during the six monitoring events. Alkalinity concentrations were relatively low, ranging from 1J to 64 mg/L. There is no GWPS for alkalinity.
- Ammonia was only detected one time in monitoring wells TW-04 and TW-30. Measured ammonia concentrations were 0.064J mg/L at TW-04 and 0.047J mg/L at TW-30. There is no GWPS for ammonia.
- Chloride was detected in all groundwater quality samples with varied concentrations during the six monitoring events. Concentrations of chloride were relatively low, ranging from 2.7J mg/L to 68.4 mg/L. There is no GWPS for chloride.
- Nitrate was detected at least once at all monitoring wells during the six monitoring events. Nitrate detected nitrate concentrations ranged from 0.044 to 2.4 mg/L. The GWPS for nitrate is 10 mg/L.
- Specific conductivity measurements were relatively low, ranging from 50.9 micro siemens per centimeter (µS/cm) to 804 µS/cm. There is no GWPS for specific conductivity.
- Sulfate was detected in 5 of the 14 monitoring wells sampled during the six monitoring events with varied concentrations. Concentrations of sulfate were relatively low, ranging from 8.1J to 60.5 mg/L. There is no GWPS for sulfate.
- TDS concentrations ranged from 13 to 349 mg/L. There is no GWPS for TDS.

Laboratory measured turbidity was less than 50 Nephelometric turbidity units (NTU) in all groundwater quality samples, except two events at TW-04 (fall 2022 and spring 2023) and one event at TW-03 (fall 2022). The highest laboratory turbidity (103.2 NTU) was measured at downgradient monitoring well TW-04 during the fall 2022 event.

General chemistry parameters monitoring wells upgradient and downgradient of Cell 9 are relatively similar and do not indicate impacts to groundwater related to landfill operations.

4.4.4.4 Summary of Findings

The significant findings from the semiannual sampling events completed in the vicinity of Cell 9 may be summarized as follows:

- Sampling results for most constituents were similar to background groundwater quality measured at the MLFRRF.
- Relatively low concentrations of VOCs were detected in groundwater, and only one VOC constituent exceedance of the GWPS was measured.
- Iron was detected in groundwater above the GWPS at downgradient monitoring wells TW-04 and TW-05 as well as at upgradient monitoring wells TW-01, TW-02, TW-02A, TW-03, and TW-03A during each monitoring event. The sampling results suggest the iron concentrations are naturally occurring and not thought to be a result of a release from the facility waste disposal area.

- Manganese was detected in groundwater above the GWPS at downgradient monitoring wells TW-04 and TW-05, at upgradient monitoring wells TW-01, TW-02, TW-02A, TW-03, and TW-03A, and at side-gradient monitoring well TW-10A during each monitoring event. Side-gradient monitoring well TW-21A also had manganese detected above the GWPS during two of six monitoring events. The sampling results suggest the manganese concentrations are naturally occurring and not thought to be a result of a release from the facility waste disposal area.
- Lead was detected above the GWPS once at downgradient monitoring well TW-29 and was subsequently resampled. Resampling of the monitoring well did not result in an exceedance of the GWPS.

In conclusion, the groundwater sampling results in the vicinity of Cell 9 at MLFRRF do not appear to represent a groundwater quality concern.

4.4.5 Production Wells

To identify all production wells within 0.5-mile of the Cell 9 boundary, Geosyntec submitted a request to MDE for a survey of production wells within one mile of the MLFRRF property boundary. The data provided by MDE on July 26, 2024, did not include reliable coordinates or addresses for many of the wells. To supplement the MDE data, Geosyntec submitted a request to Anne Arundel County to do a well search within 0.5 miles of Cell 9. The results of that well search were provided by Anne Arundel County on August 24, 2024. Using the data provided by MDE and Anne Arundel County, Geosyntec was able to compile a list of 267 production wells within 0.5 miles of Cell 9 for which location data was available, as shown in **Figure 8** and presented in **Table 2a**. Of these 267 wells, 52 wells have known locations but no well construction data was available. The remaining 215 wells have complete or partial well data available, including total well depth, static water level, water level during pumping, screen type, and screened interval. A list of 67 additional wells whose locations are unknown, but which appear to be in the vicinity of Cell 9, are presented in **Table 2b**.

Of the 334 production wells identified in the search, 279 wells are designated as private drinking water wells, 1 well is designated as industrial, commercial, or dewatering use, 2 wells are designated as agricultural usage (irrigation or livestock watering), 3 wells are designated as closed loop geothermal usage, and 49 wells have no specific designated usage in the records.

Of the 215 production wells whose locations and complete or partial well data are available, 21 production wells are likely screened in the partially confined aquifer, based on the screen interval and/or well depth. The remaining 194 production wells whose locations and complete or partial well data are available are likely screened in the confined aquifer. Due to the variability of the ground elevation in the vicinity of Cell 9, it is not possible to estimate the screen elevation of the 67 wells with no known coordinates. Additionally, it is not possible to estimate the screen elevation for the 52 wells whose locations are known but no well data is available.

Of the 21 production wells screened in the partially confined aquifer, 1 is located downgradient from Cell 9, 2 are located upgradient from Cell 9, and 18 are located cross-gradient from Cell 9. All 21 wells are used for drinking water.

Of the 194 production wells screened in the confined aquifer, 8 are located upgradient from Cell 9, 39 are located cross-gradient from Cell 9, and 147 are located downgradient from Cell 9. Two wells located cross-gradient and one well located downgradient are used as closed loop geothermal wells. While these wells terminate in the confined aquifer, they are not screened and do not interact with the aquifer. The remaining 191 wells are used for drinking water. Of the 191 drinking water wells listed as screened in the confined aquifer, 10 wells had well depth data but no screen data associated with their records. Since drinking water wells are typically screened at the bottom of the well, we assumed that these 10 wells were screened in the confined aquifer.

Of the 52 wells whose locations are known but no well data is available, 2 are located upgradient from Cell 9, 15 are located cross-gradient from Cell 9, and 35 are located downgradient from Cell 9. Due to the lack of well construction data, it is not known in which aquifer these wells are screened.

4.5 Potential Contamination of State Waters

4.5.1 Groundwater

Groundwater contamination from the operation of the landfill has occurred in the past due to historical waste disposal practices (i.e., disposal cells operated between 1975 and 1992, prior to the implementation of Subtitle D of the Resource Conservation and Recovery Act) and has influenced the groundwater quality of Sand I and Sand II and in the confined water-bearing unit in Clay I. Near Cell 9, groundwater contamination could potentially occur because of leachate leakage through the liner (see **Section 5.2**) and will most likely only influence the groundwater in Sand I and Sand II and the confined water bearing unit in Clay I. As required by the MLFRRF solid waste permit, groundwater monitoring at MLFRRF is implemented under the approved EMP (ERM 2009).

Currently, the extent of groundwater contamination in Sand I and Sand II in the vicinity of Cell 9 does not appear to be associated with landfill operations in the active portion of Cell 9. Should any leachate impact reach the monitoring wells located on the perimeter of the MLFRRF property, proper remedial action will be taken to prevent risks to human health and the environment.

Vertical movement of contaminants to the lower confined aquifers would be restricted by the composite liner system (i.e., double geomembrane over clay barrier layer; **Figure 18**) proposed to be constructed below all areas in contact with waste or leachate. Therefore, it is unlikely that leachate generated from the landfill will impact the lower confined aquifers.

4.5.2 Surface Water

Surface water contamination could potentially occur through contact with contaminated groundwater or leakage of leachate from landfill waste disposal activities. As shown in **Figures 9** through **11** and **Figures 13** and **14,** groundwater flowing beneath Cell 9 in Sand II flows beneath Wells Branch, and impacts to surface water from contamination in Sand II are therefore unlikely. As required by the MLFRRF solid waste permit, surface water monitoring at MLFRRF is implemented under the approved EMP (ERM 2009).

Additionally, direct pollution of surface waters could occur via potential seeps and outbreaks of leachate through the side slopes of the Cell 9 waste disposal area. Routine site operations and maintenance would detect any seeps and outbreaks of leachate through the side slopes that might develop. Prompt repair of such seeps and outbreaks are required, as stipulated in the operation and maintenance and post-closure care plans developed for the facility.

5 LANDFILL DESIGN

5.1 Introduction

In the remainder of this section, the specific regulatory requirements of COMAR 26.04.07.07 listed under §C(12)(a) through §C(12)(c) are reproduced in italic type. This is followed by a brief description of the conceptual design of liner system at the proposed Cell 9 vertical expansion, as well as the way the liner system design meets the specific regulatory requirement. The conceptual design for the proposed vertical expansion showing proposed liner base grades and landfill final grades is illustrated on **Figures 16** and **17**, respectively.

5.2 Liner System Design

COMAR 26.04.07.07(C)(12) requires the following:

The landfill design shall satisfy the following minimum design standards:

(a) A liner system that is designed, constructed, and installed to facilitate collection of leachate generated by the landfill to prevent migration of pollutants out of the landfill to the adjacent subsurface soil, ground water, or surface water. The liner may be constructed of natural earthen materials which are excavated from on the site, or which are imported from another location. The liner may also be constructed of a synthetic or manufactured membrane material. The liner system shall be:

(i) Constructed of materials that have sufficient strength and thickness to prevent failure due to pressure gradients, physical contact with the waste or leachate, climatic conditions, the stress of installation, and the stress of daily operation.

(ii) A minimum of 1 foot of clay or other natural material having an in-place permeability of less than or equal to 1 x 10-7th centimeters/second, or one or more unreinforced synthetic membranes with a combined minimum thickness of 50 mil, or a single reinforced synthetic membrane with a minimum thickness of 30 mil, which has a permeability less than or equal to 1 x 10-10th centimeters/second, placed over a prepared subbase with a minimum thickness of 2 feet and a permeability less than or equal to 1 x 10-5th centimeters/second. The Approving Authority may authorize the installation of a liner system with specifications different than those listed in this subparagraph only upon a successful demonstration by the applicant that the alternate system is capable of collecting and managing the leachate generated at the site, and that the liner system provides an equivalent level of protection to public health and the environment.

(iii) Placed upon a foundation or base capable of providing support to the liner and resistance to pressure gradients above and below the liner to prevent failure of the liner due to settlement, compression, uplift, puncture, cutting or activities at the landfill.

(iv) Installed to cover all surrounding earth likely to be in contact with the waste or leachate.

(v) Installed with a minimum slope of 2 percent to facilitate movement of leachate towards the leachate collection system and prevent leachate ponding on the landfill floor.

The subsections below will describe how the Cell 9 design will achieve these requirements.

5.2.1 Liner System Performance

The liner system design for the proposed landfill is shown on **Figure 18**. Subcells 9.1 and 9.2 have already been constructed, and Subcell 9.3 is under construction. The liner system for the remaining subcells in Cell 9 (i.e., Subcells 9.4 and 9.5) will be constructed with a minimum grade of 1% along the leachate pipes, while the minimum grade along the liner slope will be 2.9%. The currently permitted liner system for Cell 9 consists of the following seven component layers (from top to bottom):

- 2-foot-thick protective cover with a hydraulic conductivity no less than 5 x 10^{-3} centimeters per second (cm/s)
- Double-sided geocomposite drainage/cushion layer (leachate collection)
- 60-mil-thick textured high-density polyethylene (HDPE) geomembrane liner (primary liner)
- Double-sided geocomposite drainage/cushion layer (leak detection)
- 60-mil-thick textured HDPE geomembrane liner (secondary liner)
- 18-inch compacted clay liner with maximum hydraulic conductivity of 1 x 10^{-5} cm/s (subbase)
- Prepared subgrade with a 3-foot minimum offset from the highest observed groundwater

Subcell 9.1 was designed and built with the permitted double liner described above, except that the minimum hydraulic conductivity for the protective cover was specified at 5.2 x 10^{-2} cm/s. To meet the minimum protective cover permeability, the Subcell 9.1 protective cover consisted of #57 aggregate. Subcell 9.2 was designed and built with the permitted double liner described above, with sand with a minimum hydraulic conductivity of 5.0 x 10^{-3} cm/s used as protective cover along the floor of the cell and crushed #67 aggregate used as protective cover on all slopes greater than 10%. Subcell 9.3 is currently under construction using the same protective cover specification as Subcell 9.2.

The currently permitted liner system for Cell 9, which is not being modified as part of this process, was approved by MDE and USEPA as part of the Phase III Permit Application (Geosyntec 1994) as an alternative to the liner system prescribed in 40 CFR 258. The 1994 liner system performance demonstration report is included as **Appendix E**.

5.2.2 Liner System and Foundation Materials

The liner system materials proposed for the proposed vertical expansion of Cell 9 are unchanged from the currently permitted Cell 9 liner system materials and have been widely used in landfill applications. Based on Geosyntec's considerable previous experience, including for multiple liner system designs installed at MLFRRF, these materials will have sufficient capacity to support the landfill loads to prevent failure due to pressure gradients, physical contact with waste or leachate, climatic conditions, the stress of installation, and/or the stress of daily operation. The soils in the foundation will also have sufficient capacity to support the loads expected during construction and landfill operation. As previously discussed in **Section 4.3**, the foundation material mostly comprises clay with Standard Penetration Test N-values that range from 5 to 50+. The existing Cell 9, constructed over the same soils, has not encountered any foundation problems with excessive settlement or slope instability. The required strength for liner materials and foundation soils will be evaluated fully in the Phase III Report for the permit application.

5.3 Liner System Elevation

COMAR 26.04.07.07(C)(12)(b) requires the following:

The liner system shall be located entirely above the composite high water table as determined in §C(4)(b), of this regulation, and bedrock as determined in §C(6) of this regulation. A minimum buffer distance, including the thickness of the prepared subbase, shall be required between the bedrock elevation and the maximum expected ground water elevation, and the bottom of the liner system, as follows:

> *(i) Except as specified in §C(12)(b)(ii), the minimum buffer distance shall be 3 feet.*
>
> *(ii) In Queen Anne's, Talbot, Caroline, Dorchester, Wicomico, Somerset, and Worcester Counties, the minimum buffer distance shall be 1.5 feet unless the Department determines from the available hydrogeological data that the site can provide an additional buffer. In these instances, the Department shall set a minimum buffer between 1.5 and 3.0 feet.*

COMAR 26.04.07.07.C(12)(b)(i) requires that the buffer distance for the landfill must exceed the minimum requirement of 3 feet. The groundwater table and bottom elevation of the proposed Cell 9 was estimated by comparing the potentiometric map contours of the highest observed groundwater over the past year at Cell 9 and the proposed base grades of Cell 9. As shown on the isopachous map of soils between the highest anticipated groundwater elevation measured below the landfill and the lowest point of the subbase presented as **Figure 15,** the minimum buffer distance between the highest anticipated groundwater elevation and the lowest point of the top of subbase is approximately 9.10 feet, of which 1.5 feet will consist of subbase material. This

exceeds the minimum buffer distance of three feet that is required by COMAR 26.04.07.07.C(12)(b)(i).

5.4 Leachate Collection System

COMAR 26.04.07.07(C)(12)(c) requires that the landfill include the following:

A leachate collection and removal system, located immediately above the liner, that is designed, constructed, maintained, and operated to collect and remove leachate from the landfill. The leachate collection and removal system shall be:

(i) Constructed of materials that are chemically resistant to the waste managed in the landfill and the leachate expected to be generated, and of sufficient strength and thickness to prevent collapse under the pressures exerted by overlying wastes, waste cover materials, and by any equipment used at the landfill;

(ii) Designed and operated to function without clogging; and

(iii) Designed and operated to ensure that the leachate depth over the liner does not exceed 30 centimeters (1 foot).

Following the procedures recommended by USEPA (2020), **Appendix F** provides a leachate generation analysis for the proposed landfill using the HELP Model v4.01, which shows that the proposed leachate collection system can limit the maximum leachate depth over the geomembrane liner to less than the 30-centimeter (1-foot) limit specified in COMAR 26.04.07.07.C(12)(c)(iii). The critical condition for the leachate collection system is the open cell condition, shortly after the liner and leachate systems have been constructed and the first 8-foot-thick lift of waste has been placed. The main component of the leachate collection system is a geocomposite drainage layer and protective cover drainage layer over the entire aerial expanse of the liner (**Figure 18**). The proposed geocomposite drainage layer, which has high chemical resistance and was specifically developed for use in landfill and similar applications, consists of a geonet layer sandwiched between two geotextile layers. The latter serve as filters, preventing the migration of fines into the geonet drainage component. Leachate drainage corridors will also be installed to limit the drainage length in the geocomposite to 750 feet.

As shown in the HELP model (**Appendix F**), the leachate collection system has sufficient drainage capacity; the maximum expected leachate depth over the geomembrane liner for the proposed liner and leachate collection system is 9.5 inches in the protective cover/leachate collection zone and 0.18 inches in the leak detection zone during what is anticipated to be the most critical condition for leachate flow. The proposed liner system discussed in **Section 5.2** is therefore expected to be capable of collecting and managing the leachate generated in the expansion such that the liner system provides an equivalent level of protection to public health and the environment afforded by MDE's prescriptive liner.

As part of the Phase III Report that will be submitted to MDE, detailed design calculations will be conducted to evaluate the adequacy of the proposed geocomposite layer's drainage capacity, material strength, and clogging potentials for use as the primary component of the leachate collection system.

COMAR 26.04.07.07C	Where Addressed
ii. A minimum of 1 foot of clay or other natural material having in place permeability of less than or equal to 10^{-7} cm/s or a single reinforced synthetic membrane with minimum thickness of 30 mil with permeability less than or equal to 10^{-10} cm/s placed over prepped subbase with a minimum thickness of 2 ft and permeability less than 10^{-5} cm/s. Alternative liner systems may be used after successful demonstration that they are capable of collecting and managing leachate generated at the site and that they provide an equivalent level of protection to public health and the environment	**Section 5.2.1, Figure 18**
iii. Placed upon a foundation providing support to the liner and resistance to pressure gradients to prevent failure of liner due to settlement, compression, uplift, puncture, cutting, or activities at the landfill	**Section 5.2.2**
iv. Installed to cover all surrounding earth likely to contact waste or leachate	**Section 5.2.1, Figure 16**
v. Installed with minimum slope of 2% for drainage	**Section 5.2.1, Figure 16**
b) The liner system shall be located entirely above the composite high water table and bedrock. A minimum buffer distance, including thickness of prepared subbase, between bedrock elevation and maximum expected groundwater elevation, and the bottom of the liner system shall be required as follows:	**Section 5.3**
i. Minimum buffer distance of 3 ft unless otherwise specified (see below)	**Section 5.3, Figure 15**
ii. In Queen Anne's, Talbot, Caroline, Dorchester, Wicomico, Somerset, and Worcester Counties - minimum buffer distance of 1.5 ft. (unless MD DOE determines that site can provide additional buffer – up to 3 ft)	**Not Applicable**
c) A leachate collection and removal system. This system shall be:	**Section 5.4**
i. Constructed of materials that are chemically resistant to the waste managed in the landfill and the leachate to be generated and of sufficient strength and thickness to prevent collapse	**Section 5.4**
ii. Designed and operated to function without clogging	**Section 5.4**
iii. Designed and operated to ensure that leachate depth over liner does not exceed 30 cm (1 ft).	**Section 5.4**

4.3.1. Potentiometric and Isopachous Maps	Figures 9–11 and 15
4.3.2. Aquifer Testing	Not applicable
4.3.3. Groundwater Movement	Section 4.4.3
4.3.4. Potential Pollutant Movement in Groundwater	Section 4.5.1
4.4. Groundwater Quality	
4.4.1. Compilation and Report of Initial Results	Section 4.4.4, Tables 4–7
4.4.2. Determination of Difference between Populations	Section 4.4.4
4.4.3. Discussion of Selected Detected Constituents	Section 4.4.4
4.4.4. Impacts of Previous Activity at the Site	Section 4.4.4
4.4.5. Detections that Exceed Maryland's Groundwater Standard	Section 4.4.4
4.5. Surrounding Groundwater Use	Section 4.4.5, Tables 2a and 2b, Figure 8
5. SURFACE WATER ASSESSMENT HYDROLOGY	
5.1. Surface Water Description	Section 4.2, Figure 3
5.2. Floodplain	Figure 4
5.3. Endangered Species Study	Section 2.2
5.4. Potential Pollutant Movement in Surface Water	Section 4.5.2
6. FINDINGS, DESIGN CONSIDERATION AND CONCLUSION	
6.1. Findings	Section 5
6.2. Design Considerations	Section 5
6.2.1. Preliminary conceptual design of the proposed landfill based on the geotechnical information	Section 5, Figures 16–18
6.3. Conclusion	Section 5
6.4. Recommendations	Section 5

Notes:

Source: Maryland Department of the Environment (MDE) Well Permits FOIA Request received July 26, 2024, and Anne Arundel County Well Seach Request received August 21, 2024. Refer to Figure 8 for well locations based on coordinates provided by MDE and Anne Arundel County.

Well locations are plotted on a map in Figure 8, labeled with the well identification number.

-: Well construction data not available

PL: Plastic

ST: Steel

DW: Usage code for residential or public

C: Usage code for closed loop geothermal well

1. Coordinate data in reference to the Maryland State Plane Datum.
2. Groundwater elevations were measured on a monthly basis between January 2022 and December 2023.
3. Data point is inconsistent with previous groundwater elevation is suspected to be erroneous.
ft: feet
ft-NGVD29: National Geodetic Vertical Datum of 1929
NM: not measured

Table 4. Summary of Volatile Organic Compounds in Groundwater
Phase II Report: Site Geologic Study
Proposed Millersville Landfill and Resource Recovery Facility Vertical Expansion
Severn, Anne Arundel County, Maryland

Notes:

Groundwater Protection Standard from State of Maryland Department of the Environmental Cleanup Standards for Soil and Groundwater (MDE 2018)

Bolded: sample concentration detected greater than the method detection limit.

Bolded and highlighted: sample concentration detected greater than GWPS.

B: Analyte was detected in the associated method blank

CH: The continuing calibration for this compound is outside of Pace Analytical acceptance limits. The results may be biased high.

H2: Extraction or preparation conducted outside USEPA method holding time.

U: Analyte not detected above the method detection limit. The result is shown non-detect at the reporting limit.

2c: Alkalinity TV: 0.00 mg/L

5c: pH was adjusted to <2 at bench.

J: Reported concentration is estimated. Result is between the reporting limit and method detection limit.

L1: Analyte recovery in the laboratory control sample (LCS) was above QC limits. Results for this analyte in associated samples may be biased high.

L0: Analyte recovered outside of the LCS limit.

µg/L: micrograms per liter

mg/L: milligrams per liter

Notes:
Groundwater Protection Standard from State of Maryland Department of the Environmental Cleanup Standards for Soil and Groundwater (MDE 2018)
Bolded and highlighted - Sample concentration detected greater than GWPS
J: Reported concentration is estimated. Result is between the reporting limit and method detection limit.
M1: Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.
mg/L: milligrams per liter
NA: not analyzed
NS: no applicable GWPS available
R1: RPD value was outside control limits.
U: Analyte not detected above the reporting limit.

Notes:
Groundwater Protection Standard from State of Maryland Department of the Environmental Cleanup Standards for Soil and Groundwater (MDE 2018)
mg/L: milligrams per Liter
U: Analyte not detected above the reporting limit.
J: Reported concentration is estimated. Result is between the reporting limit and method detection limit.
NA: not analyzed
NS: no applicable GWPS available
SU: standard units
NTU: Nephelometric turbidity units
µS: microSeimens
µmhos/cm: micromhs per centimeter
3c: Alkalinity TV: 3.00 mg/L
2c: Alkalinity TV: 2.00 mg/L
1c: Alkalinity TV: 0.00 mg/L
5c: pH adjusted to <2 in lab at bench prior to analysis
4c: Alkalinity TV: 4.00 mg/L
ML: Matrix spike recovery and/or matrix spike duplicate recovery was below laboratory control limits. Result may be biased low.

FLOOD HAZARD INFORMATION

SEE FIS REPORT FOR DETAILED LEGEND AND INDEX MAP FOR DRAFT FIRM PANEL LAYOUT

SPECIAL FLOOD HAZARD AREAS	Without Base Flood Elevation (BFE) *Zone A, V, A99*
	With BFE or Depth *Zone AE, AO, AH, VE, AR*
	Regulatory Floodway
OTHER AREAS OF FLOOD HAZARD	0.2% Annual Chance Flood Hazard, Areas of 1% annual chance flood with average depth less than one foot or with drainage areas of less than one square mile *Zone X*
	Future Conditions 1% Annual Chance Flood Hazard *Zone X*
	Area with Reduced Flood Risk due to Levee See Notes *Zone X*
	Area with Flood Risk due to Levee *Zone D*
OTHER AREAS	NO SCREEN Area of Minimal Flood Hazard *Zone X*
	Effective LOMRs
	Area of Undetermined Flood Hazard *Zone D*
GENERAL STRUCTURES	Channel, Culvert, or Storm Sewer
	Levee, Dike, or Floodwall
OTHER FEATURES	20.2 Cross Sections with 1% Annual Chance
	17.5 Water Surface Elevation
	8 Coastal Transect
	Coastal Transect Baseline
	Profile Baseline
	Hydrographic Feature
	513 Base Flood Elevation Line (BFE)
	Limit of Study
	Jurisdiction Boundary

NOTES TO USERS

For information and questions about this Flood Insurance Rate Map (FIRM), available products associated with this FIRM, including historic versions, the current map date for each FIRM panel, how to order products, or the National Flood Insurance Program (NFIP) in general, please call the FEMA Map Information eXchange at 1-877-FEMA-MAP (1-877-336-2627) or visit the FEMA Flood Map Service Center website at https://msc.fema.gov. Available products may include previously issued Letters of Map Change, a Flood Insurance Study Report, and/or digital versions of this map. Many of these products can be ordered or obtained directly from the website.

Communities annexing land on adjacent FIRM panels must obtain a current copy of the adjacent panel as well as the current FIRM Index. These may be ordered directly from the Flood Map Service Center at the number listed above.

For community and countywide map dates, refer to the Flood Insurance Study Report for this jurisdiction.

To determine if flood insurance is available in this community, contact your Insurance agent or call the National Flood Insurance Program at 1-800-638-6620.

Basemap information shown on this FIRM was provided in digital format by USDA, Farm Service Agency (FSA). This information was derived from NAIP, dated April 11, 2018.

This map was exported from FEMA's National Flood Hazard Layer (NFHL) on **6/4/2024 6:57 PM** and does not reflect changes or amendments subsequent to this date and time. The NFHL and effective information may change or become superseded by new data over time. For additional information, please see the Flood Hazard Mapping Updates Overview Fact Sheet at https://www.fema.gov/media-library/assets/documents/118418

This map complies with FEMA's standards for the use of digital flood maps if it is not void as described below. The basemap shown complies with FEMA's basemap accuracy standards. This map image is void if the one or more of the following map elements do not appear: basemap imagery, flood zone labels, legend, scale bar, map creation date, community identifiers, FIRM panel number, and FIRM effective date.

Project Description

The Anne Arundel County Department of Public Works has proposed to begin construction of additional facilities that are needed to support Cell 9 at the Millersville Landfill and Resource Recovery Facility (herein referenced as the MLFRRF) on Burns Crossing Road in northern Anne Arundel County, Maryland. The MLFRRF waste disposal Cell 8 was permitted by Maryland Department of the Environment (MDE) in the early 1990's. Landfilling in Cell 8 began in 1992 and based on various waste disposal rate scenarios developed by Anne Arundel County – Waste Management Services (AAC-WMS), the Cell 8 area is expected to reach its permitted capacity sometime between 2014 and 2016.

The MLFRRF waste disposal Cell 9 was permitted by MDE in August, 1997 (WQC 97-NT-0501/199001846) and the U.S. Army Corps of Engineers (USCOE) in June 1997 (CENAB-OP-RW 90-01846-4). Construction activities of Cell 9 performed to date include the Cell 9 bridge crossing over Wells Branch, an access road parallel to Wells Branch, and general grading of wetlands approved under 1997 permits.

Construction of Cell 9 is necessary to accommodate the County's waste disposal as the active landfill cell (Cell 8) reaches capacity. The proposed project will include the construction of Cell 9, a stormwater/sedimentation pond (Pond 9-2) with a discharge into Wells Branch, and a soil stockpile/borrow area. Cell 9 is a double-lined disposal area, approximately 84 acres in size. The Cell 9 area is projected to reach its permitted capacity sometime between 2030 (275,000 tons per year scenario) and 2059 (110,000 tons per year scenario) depending on varied County waste disposal rate scenarios.

Purpose

The purpose of this report is to describe wetland and waterways investigations performed within the proposed project study areas. This report was prepared in part to satisfy the regulatory requirements of the U.S. Army Corps of Engineers (USCOE), which has jurisdictional authority over wetlands and waterways of the United States under the purview of Section 404 of the Clean Water Act, and the Maryland Department of the Environment (MDE) which has authority over wetlands and waterways under the Non-tidal Wetlands Protection Act & Program and the Waterway Construction Statute.

Study Area Description

The project study area is approximately 125 acres dominated by deciduous forest (Figure 1). The proposed Cell 9 area borders existing Cell 8 and combined Cells 5-6-7. The proposed project study area is located in the Western Shore Uplands Region of the Coastal Plain Province of Maryland (MGS, 2001).

One USGS mapped intermittent stream, Wells Branch, is located within the project study area (Figure 2). At the MLFRRF, surface water flows into Wells Branch from stormwater runoff from undeveloped areas, wetland seeps and outfalls from sediment basins, ponds and traps. Upon leaving the MLFRRF property, Wells Branch flows east to the confluence with Severn Run, which, in turn, flows into the Severn River. Topography along the project study area alignment is rolling with elevations ranging between 80 feet above mean sea level along the floodplain of Wells Branch to approximately 240 feet along the southern border of the project study area. Located within the floodplain of Wells Branch, one palustrine forested broad-leaf deciduous, seasonal wetland (PFO1C) is identified on the USFWS National Wetlands Inventory (NWI) mapping (Figure 3).

Figure 1. Project Study Area Location Map.
Source: Google Earth. Accessed October 17, 2007. http://earth.google.com
Scale: 1 inch = approximately 2700 feet

Figure 2. USGS Topographic Map.
Source: USGS Topographic Map 7.5' Quadrangle, (Odenton, MD 1979).
Scale: 1 inch = approximately 2300 feet

Figure 3. National Wetlands Inventory (NWI) Map.
Source: U.S. Fish and Wildlife Service. NWI Wetlands Online Mapper. Accessed October 17, 2007. http://wetlandsfws.er.usgs.gov/wtlnds/launch.html
Scale: 1 inch = approximately 1000 feet

The floodplain forest along Wells Branch is dominated by red maple (*Acer rubrum*), black gum (*Nyssa sylvatica*), tulip poplar (*Liriodendron tulipifera*), and willow oak (*Quercus phellos*). The shrub layer was dominated by sweet pepperbush (*Clethra alnifolia*), sweetbay magnolia (*Magnolia virginiana*), American holly (*Ilex opaca*), winterberry (*Ilex verticillata*) and highbush blueberry (*Vaccinium corymbosum*). Common greenbrier (*Smilax rotundifolia*), Asiatic tearthumb (*Polygonum perfoliatum*), and microstegium (*Microstegium viminea*) where the common vines and herbs.

The upland forest is dominated by red maple, tulip poplar, pitch pine (*Pinus rigida*), chestnut oak (*Quesrcus prinus*), red oak (*Quercus rubra*), white oak (*Quercus alba*), black oak (*Quercus nigra*) and black cherry (*Prunus serotina*). The shrub layer was dominated by American holly and highbush blueberry. Extensive deer-browse limited the growth of vines and herbs within the upland forest community.

Soil series were identified through a review of the USDA Natural Resources Conservations Service Web Soils Survey for Anne Arundel County (USDA, 2007). Soils mapped within the project study area include Downer-Hammonton complex (DvB, DvC and DvD), Downer-Phalanx complex (DxC and DxD), Evesboro and Galestown soils (EVC), Sassafras fine sandy loam (SaB), Sassafras-Hambrook complex (ShA), Sassafras and Croom soils (SME and SMF), Udorthents, refuse substratum (UfG) and Woodstown sandy loam (WdB). None of soils are listed as hydric soils at the federal, state or local level (Figure 4).

Soil Name	Soil Map Unit	Acres in Study Area	National, State or Local Hydric Soils List
Downer-Hammonton Complex	DvB, DvC, DvD	42.8	Not Listed

Scale: 1 inch = approximately 800 feet

Methods

The study area was investigated for palustrine wetland indicators of vegetative composition, soil development and hydrology. The investigation was conducted in accordance with the *Corps of Engineers Wetlands Delineation Manual* (Environmental Laboratory, 1987). Due to the size and characteristics of the study area, the Routine-On-Site Determination method was used. If present, wetlands within and directly adjacent to the limits of proposed work were delineated so that their presence could be shown on project mapping to aid in impact avoidance during engineering design.

Soils were characterized by evaluating the upper horizons of the soil profile. Soil pits were dug using a "sharpshooter" spade with a 14-inch blade. Soil horizons were evaluated using normal field protocols for determining texture and nomenclature. The *Munsell Soil Color Charts* (Macbeth Division of Kollmorgen

Instruments Corporation, 1994) were used to determine the colors of horizons and redoximorphic features. Reducing condition determinations in soils were performed in the field using presence/absence of mottles, low chroma colors and presence of concretions.

Data point locations were investigated for primary and secondary wetland hydrology indicators. If present, wetland boundaries were marked using pink wetland flagging. Wetland boundary data points were located using a Trimble ™ ProXR®Global Positioning System (GPS). The Trimble ™ ProXR® is capable of attaining sub-meter accuracy (Trimble, 1997). The GPS data were then transferred onto relevant site mapping using the U.S. State Plane, 1927, Maryland coordinate system. Wetlands were identified on site base mapping to show their proximity to the proposed construction areas. Classifications were assigned to each wetland following the Cowardin et al methods (1979). Color photographs were taken of all relevant features to document site conditions during the time of the investigations.

Vegetation was identified using *A Field Guide to Trees and Shrubs* (Petrides 1986), *Newcomb's Wildflower Guide* (Newcomb 1977) and *Grasses An Identification Guide* (Brown 1979). Plant species were assigned an indicator status [e.g., Upland (UPL), Facultative Upland (FACU), Facultative (FAC), Facultative Wetland (FACW), or Obligate Wetland (OBL) based on the USFWS's *National List of Plant Species that Occur in Wetlands: 1988 National Summary* (Reed 1988).

Wetland function and value assessments were performed at each wetland location (if present) using the methods outlined in *The Highway Methodology Workbook Supplement, Wetland Functions and Values A Descriptive Approach*, USCOE New England Division (NEDEP-360-1-30a 1995). Wetland functions were evaluated and recorded using the standard wetland function-value evaluation form.

Waterways (if present) were identified through a review of available mapping and field investigations. Topographic and engineering maps were reviewed for the presence of streams within the project area. Field investigations for waterways were performed in conjunction with the wetland field investigation and included the field verification of mapped watercourses and the identification and delineation of streams, springs, and seeps that were not shown on existing engineering plans. Waterways were identified by the presence of bed and banks and/or ordinary high water marks. The flow regime of each identified waterway was characterized based upon field indicators of hydrologic, floral, and faunal character at the time of the investigation. All identified waterways were located using GPS and photographed.

Results

Wetlands: The study area was field investigated for palustrine wetland indicators of vegetative composition, soil development, and hydrologic characteristics on October 15th and 16th, 2007. Weather conditions were warm, clear and dry with temperatures ranging between 65 and 80°F. Preliminary precipitation data indicated no rainfall for the Baltimore area 48-hours prior to the investigation.

Two wetlands were identified within the project study area. Wetland 1 (5.70 acres) was a palustrine forested wetland (PFO) located within the floodplain of Wells Branch. The tree canopy was dominated by red maple (*Acer rubrum*), black gum (*Nyssa sylvatica*), tulip poplar (*Liriodendron tulipifera*), and willow oak (*Quercus phellos*). The shrub layer was dominated by sweet pepperbush (*Clethra alnifolia*), sweetbay magnolia (*Magnolia virginiana*), American holly (*Ilex opaca*), winterberry (*Ilex verticillata*) and highbush blueberry (*Vaccinium corymbosum*). Common greenbrier (*Smilax rotundifolia*), Asiatic

tearthumb (*Polygonum perfoliatum*), and microstegium (*Microstegium viminea*) were the common vines and herbs. Primary hydrologic indicators included inundation and saturated soils in places, drainage patterns and drift lines. Secondary indicators included oxidized root channels, water-stained leaves and buttressed tree roots. Soil samples at various locations throughout Wetland 1 were primarily a sandy silt loam with low-chroma and mottling. Soils of Wetland 1 were hydric.

Wetland 2 (0.17 acres) was a small palustrine forested wetland (PFO) located within the floodplain of Wells Branch near the eastern limit of the project study area. The tree canopy was dominated by red maple, black gum, and white oak (*Quercus alba*). The shrub layer was dominated by sweetbay magnolia and American holly. Microstegium dominated the herbaceous layer within Wetland 2. Primary hydrologic indicators included saturated soils and drainage patterns. Soils were primarily a silty sand with low-chroma and mottles. Soils of Wetland 2 were hydric.

Waterways: Wells Branch was confirmed in the field. Wells Branch ranged in width between three and eight feet within the project study area with an average width of five feet. The western half of Wells Branch located within the project study area was poorly defined in places, reverting to overland flow before becoming channelized several hundred feet downstream. With an average width of three feet, the top of bank of the western half of Wells Branch varied between three inches and two feet above the streambed. The stream substrate was predominantly sand. Intermittent flow was only observed within the western half of the study area. Approximately 70% of Wells Branch located within the project study area exhibited no flow and no standing water during the investigation. During the investigation, Wells Branch exhibited no flow east (downstream) of wetland flag W1-101 (See Appendix A).

The eastern half of Wells Branch was highly channelized as the combined discharge of several stormwater ponds (Ponds 3, 4 and 5) increased erosion of the sandy alluvial soils of the floodplain. With an average width of six feet, the top of bank of the eastern half of Wells Branch varied between two feet and four feet above the streambed. The stream substrate was predominantly sand. The streambanks of the eastern half of Wells Branch exhibited considerable erosion and undercutting and exhibited no flow during the investigation.

Several small spring/seeps were identified within the limits of Wetland 1, located between wetland flags W1-13 and W1-27. The small channels created by the spring/seeps were not well defined, were less than two feet wide and the water level averaged less than one inch deep during the investigations. One additional spring/seep, not associated with a wetland, was mapped and photographed.

Summary

Field investigations conducted by Gannett Fleming, Inc. on October 15th and 16th, 2007 to identify and delineate wetlands and waterways within the project study area were conducted in accordance with the 1987 U.S. Army Corps of Engineers Wetlands Delineation Manual. Wells Branch was confirmed in the field. Intermittent flow was only observed within the western half of the study area. Although no flow was observed during the investigations, the eastern half of Wells Branch was highly channelized as the combined discharge of several stormwater ponds (Ponds 3, 4 and 5) increased erosion of the sandy alluvial soils of the floodplain. Two palustrine forested wetlands were identified and mapped adjacent to Wells Branch. Several small spring/seeps were identified within the limits of Wetland 1. The small channels created by the spring/seeps were not well defined. One additional spring/seep, not associated with a wetland, was identified and mapped as part of the investigation.

Wetland ID	Cowardin Classification	Wetland Size (acres)
Wetland 1	PFO	5.70
Wetland 2	PFO	0.17

Stream ID	Flow Regime	Stream Width (feet)
Wells Branch	Intermittent	5.0

Map Unit Name (Series & Phase):	Zekiah and Issue Soils (ZBA)
Taxonomy (Subgroup):	Typic Fluvaquents/Fluvaquentic Dystrudepts
Drainage Class:	Poorly drained/Somewhat poorly drained
Field Observations Confirmed Mapped Type?	No

Profile Description:

Depth (Inches)	Horizon	Matrix Color (Munsell Moist)	Mottle Colors (Munsell Moist)	Mottle Abundance/Contrast	Texture, Concretions, Structures, Etc.
2-0	O	2.5Y 2.5/1	-	-	Organic layer of decayed leaves
0-9	A	7.5YR 7/2	-	-	Dry sand
9-18	B	7.5YR 6/8	-	-	Dry sand

Hydric Soil Indicators

	Histol		**Concretions**
	Histic Epipedon		**High Organic Content in Surface Layer in Sandy Soils**
	Sulfidic Odor		**Organic Streaking in Sandy Soils**
✓	**Aquic Moisture Regime**		**Listed on Local Hydric Soils List**
	Reducing Conditions		**Listed on National Hydric Soils List**
	Gleyed or Low-chroma Color		**Other (Explain in Remarks)**

Remarks:

This soil does not exhbit characteristics indicative of wetland soils.

WETLAND DETERMINATION			
Is Hydrophytic Vegetation Present?	No	**Is The Sampling Point Within A Wetland?**	No
Is Wetland Hydrology Present?	No		
Are Hydric Soils Present?	No		

Remarks:

Location of Sampling Point: This sampling point is located along the upland forested section beyond the floodplain boundary of Wells Branch.

DATA FORM
ROUTINE WETLAND DETERMINATION
(1987 ACOE Wetland Delineation Manual)

APPENDIX D
FUNCTION AND VALUE SHEETS

Wetland 1

Wetland Function-Value Evaluation Form

Total Area of Wetland 5.70 acres Human made? No Is wetland part of a wildlife corridor? Yes Or a "habitat island"? No

Adjacent land use Active Landfill and Deciduous Forest

Distance to nearest road or development is 50 ft

Dominant wetland system present is PFO Is a Contiguous undeveloped buffer zone present? Yes

Is the wetland a separate hydraulic system? No If not, where does the wetland lie in the drainage basin? Middle

How many tributaries contribute to the wetland? One, Wells Branch

Wetland ID: Wetland 1

Prepared by: Steve Smith, GF

Wetland impact:
Type: unknown Area: unknown

Evaluation based on:
Office No Field Yes

Corps manual wetland delineation completed? Yes

Function/Value	Suitability Y	Suitability N	Rationale (Reference #)	Principal F/V	Comments
Groundwater Recharge/Discharge	X		4, 7, 13		Several spring/seeps were observed within the limits of Wetland 1. Groundwater expression observed in the upstream portion of Wells Branch disappeared underground within the limits of Wetland 1 and did not provide enough hydrology to maintain flow throughout the extent of Wells Branch located within the project study area.
Floodflow Alteration	X		5, 6, 8, 9, 10, 13, 14, 18	X	Wetland 1 is a large wetland located within the floodplain of Wells Branch has significant floodflow alteration potential based on its small area.
Fish and Shellfish Habitat		X			Wells Branch provides limited fish habitat in places but Wetland 1 does not.
Sediment/Toxicant Retention	X		1, 2, 10, 16		Wetland along Wells Branch carries runoff from the adjacent landfill. Erosion of the Wells Branch stream channel through portions of Wetland 1 is severe.
Nutrient Removal		X			
Production Export		X			
Sediment/Shoreline Stabilization	X		1, 3, 4, 5 (in places), 6 (in places), 7, 9, 12, 14, 15		Wetland along Wells Branch carries runoff from the adjacent landfill. Erosion of the Wells Branch stream channel through portions of Wetland 1 is severe.
Wildlife Habitat	X		3, 5, 6, 7, 8, 13, 15, 17		Deer and multiple bird species were observed within Wetland 1.
Recreation		X			
Educational/Scientific Value		X			
Uniqueness/Heritage		X			
Visual Quality/Aesthetics		X			
ES Endangered Species Habitat		X			
Other		X			

Wetland 2

Wetland Function-Value Evaluation Form

Total Area of Wetland 0.17 acres Human made? No Is wetland part of a wildlife corridor? Yes Or a "habitat island"? No

Adjacent land use Active Landfill and Deciduous Forest

Distance to nearest road or development is 200 ft

Dominant wetland system present is PFO Is a Contiguous undeveloped buffer zone present? Yes

Is the wetland a separate hydraulic system? No If not, where does the wetland lie in the drainage basin? Middle

How many tributaries contribute to the wetland? One, Wells Branch

Wetland ID: Wetland 2

Prepared by: Steve Smith, GF

Wetland impact:
Type: unknown Area: unknown

Evaluation based on:
Office No Field Yes

Corps manual wetland delineation completed? Yes

Function/Value	Suitability Y	Suitability N	Rationale (Reference #)	Principal F/V	Comments
Groundwater Recharge/Discharge		X			
Floodflow Alteration	X		5, 9, 10, 13		Small wetland located within the floodplain of Wells Branch has limited floodflow alteration potential based on its small area.
Fish and Shellfish Habitat		X			
Sediment/Toxicant Retention	X		1, 2, 10		Wetland along Wells Branch carries runoff from the adjacent landfill. Erosion of the Wells Branch stream channel adjacent to Wetland 2 is severe. Wetland 2 has limited potential to retain sediment and toxins based on its small size.
Nutrient Removal		X			
Production Export		X			
Sediment/Shoreline Stabilization		X			
Wildlife Habitat		X			
Recreation		X			
Educational/Scientific Value		X			
Uniqueness/Heritage		X			
Visual Quality/Aesthetics		X			
ES Endangered Species Habitat		X			
Other		X

Re: Joint Federal/State Application for the Alteration of Any Floodplain, Waterway, Tidal or Nontidal Wetland in Maryland
Site Name: Millersville Landfill and Resource Recovery Facility Cell 9
Project No.: Anne Arundel County No. N530600
Contract No.: N530601

Dear Ms. Cole:

Anne Arundel County Department of Public Works is submitting one (1) original and four (4) copies of the enclosed *Joint Federal/State Application for the Alteration of Any Floodplain, Waterway, Tidal or Nontidal Wetland in Maryland* for your review and approval.

Anne Arundel County has proposed to begin construction of soil stockpile and borrow area facilities that are needed to support the Cell 9 waste disposal activities at the Millersville Landfill and Resource Recovery Facility (MLFRRF). The construction includes a soil stockpile/borrow area within the Cell 9 area, and a stormwater/sedimentation pond (Pond 9-2) with a Coastal Plains Outfall into Wells Branch a tributary to Severn Run and the Severn River. This project was discussed at our Joint Agency Review Group meeting on November 20, 2007.

Upon receiving your date and time notification for a wetland delineation for the subject project, I will notify our Environmental Consultant and the Owner/Operator of MLFRRF to join you at the site.

Our principal contact for the Millersville Landfill and Resource Recovery Facility, Cell 9, is Stephen Krajcsik, Disposal and Maintenance Manager. His address is 389 Burns Crossing Road, Severn, Maryland 21144.

Thank you for your assistance in this matter. If you have any questions concerning this matter, please contact Mr. Krajcsik at 410-222-6108 or me at 410-571-0092.

Sincerely,

Phillip D. Guyer

Revised 07/07

JOINT FEDERAL/STATE APPLICATION FOR THE ALTERATION OF ANY FLOODPLAIN, WATERWAY, TIDAL OR NONTIDAL WETLAND IN MARYLAND

FOR AGENCY USE ONLY

Application Number _____ **Date Determined Complete** _____

Date Received by State _____ **Date(s) Returned** _____

Date Received by Corps _____

Type of State permit needed _____ **Date of Field Review** _____

Type of Corps permit needed _____ **Agency Performed Field Review** _____

++

- Please submit 1 original and 4 copies of this form, required maps and plans to the Wetlands and Waterways Program as noted on the last page of this form.
- Any application which is not completed in full or is accompanied by poor quality drawings may be considered incomplete and result in a time delay to the applicant.

Please check one of the following:

RESUBMITTAL: ____ **APPLICATION AMENDMENT:** ____ **MODIFICATION TO AN EXISTING PERMIT:** ____

JURISDICTIONAL DETERMINATION ONLY ____ **APPLYING FOR AUTHORIZATION** X

PREVIOUSLY ASSIGNED NUMBER (RESUBMITTALS AND AMENDMENTS) _____

DATE January 24, 2008

1. APPLICANT INFORMATION:

APPLICANT NAME:

A. Name: Stephen J. Krajcsik, P.E. B. Daytime Telephone: 410-222-~~6177~~ 6108

C. Company: Anne Arundel County Department of Public Works

D. Address: 389 Burns Crossing Road

E. City: Severn State: Maryland Zip: 21144

AGENT/ENGINEER INFORMATION:

A. Name: James A Leiper, P.E. B. Telephone: 717-763-7211 ext. 2793

C. Company: Gannett Fleming, Inc.

D. Address: 207 Senate Avenue

E. City: Camp Hill State: Pennsylvania Zip: 17011

ENVIRONMENTAL CONSULTANT:

A. Name: David H. Graff, P.W.S., C.E. B. Telephone: 717-763-7211 ext. 2073

C. Company: Gannett Fleming, Inc.

D. Address: 207 Senate Avenue

E. City: Camp Hill State: Pennsylvania Zip: 17011

CONTRACTOR (If known): **Unknown at this time**

A. Name: _____ B. Telephone: _____

C. Company: _____

D. Address: _____

E. City: _____ State: _____ Zip: _____

PRINCIPAL CONTACT:

D. Address: 207 Senate Avenue

E. City: Camp Hill State: Pennsylvania Zip: 17011

2. PROJECT DESCRIPTION

a. GIVE WRITTEN DESCRIPTION OF PROJECT:

Construction of Cell 9 is necessary to accommodate the County's waste disposal as the active landfill cell (Cell 8) reaches capacity. The proposed project will include the construction of Cell 9, a stormwater/sedimentation pond (Pond 9-2) with a discharge into Wells Branch, and a soil stockpile/borrow area. Cell 9 is a double-lined disposal area, approximately 84 acres in size. The Cell 9 area is projected to reach its permitted capacity sometime between 2030 (275,000 tons per year scenario) and 2059 (110,000 tons per year scenario) depending on varied County waste disposal rate scenarios.

Has any portion of the project been completed? X Yes ____ No If yes, explain

The Millersville site waste disposal Cell 9 was permitted by MDE in August, 1997 (WQC 97-NT-0501/199001846) and the U.S. Army Corps of Engineers (USCOE) in June 1997 (CENAB-OP-RW 90-01846-4). Construction activities of Cell 9 performed to date include the Cell 9 bridge crossing over Wells Branch, an access road parallel to Wells Branch, and general grading of wetlands approved under 1997 permits.

Is this a residential subdivision or commercial development? ____ Yes X No

If yes, total number of acres on property ____ acres

b. ACTIVITY: Check all activities that are proposed in the wetland, waterway, floodplain, and nontidal wetland buffer as appropriate.

A. X filling
B. ____ dredging
C. X excavating
D. ____ flooding or impounding water
E. ____ draining
F. X grading
G. X removing or destroying vegetation
H. ____ building structures

Area for item(s) checked: Wetland 1,906 (sq. ft.) Buffer (Nontidal Wetland Only) 11,732 (sq. ft.)

Expanded Buffer (Nontidal Wetland Only) NA (sq. ft.)

Area of stream impact NA (sq. ft.)

Length of stream affected NA (linear feet)

c. TYPE OF PROJECTS: Project Dimensions

For each activity, give overall length and width (in feet), in columns 1 and 2. For multiple activities, give total area of disturbance in square feet in column 3. For activities in tidal waters, give maximum distance channelward (in feet) in column 4. For dam or small ponds, give average depth (in feet) for the completed project in column 5. Give the volume of fill or dredged material in column 6.

			Length (Ft.) 1	Width (Ft.) 2	Area Sq. Ft. 3	Maximum/Average Channelward Encroachment 4		Pond Depth 5	Volume of fill/dredge material (cubic yards) below MHW or OHW 6
A.		Bulkhead							
B.		Revetment							
C.		Vegetative Stabilization							
D.		Gabions

1. ____ New 2. ____ Maintenance 3. ____ Hydraulic 4. ____ Mechanical

W. Other (explain) Fill of the MDE 25-foot buffer along Wetland 1 associated with the construction of a 30-foot wide perimeter access road around the proposed soil stockpile/borrow area (See Regulated Activities Plan)

- Area of fill in Wetland Buffer = 2,880 square feet

Fill of the MDE 25-foot buffer along Wetland 1 associated with the construction of the proposed sediment basin Pond 9-2 (See Regulated Activities Plan)

- Area of fill in Wetland Buffer = 5,000 square feet

Temporary impacts to Wetland 1 and fill of the MDE 25-foot buffer associated with the construction of the proposed coastal plain outfall from sediment basin Pond 9-2 (See Regulated Activities Plan)

- Area of temporary impacts to Wetland 1 = 1,906 square feet
- Area of fill in Wetland Buffer = 3,852 square feet

d. PROJECT PURPOSE: Give brief written description of the project purpose:

The Anne Arundel County Department of Public Works has proposed to begin construction of additional facilities that are needed to support Cell 9 at the Millersville Landfill and Resource Recovery Facility (herein referenced as the MLFRRF) on Burns Crossing Road in northern Anne Arundel County, Maryland. The MLFRRF waste disposal Cell 8 was permitted by Maryland Department of the Environment (MDE) in the early 1990's. Landfilling in Cell 8 began in 1992 and based on various waste disposal rate scenarios developed by Anne Arundel County – Waste Management Services (AAC-WMS), the Cell 8 area is expected to reach its permitted capacity sometime between 2014 and 2016.

The MLFRRF waste disposal Cell 9 was permitted by MDE in August, 1997 (WQC 97-NT-0501/199001846) and the U.S. Army Corps of Engineers (USCOE) in June 1997 (CENAB-OP-RW 90-01846-4). Construction activities of Cell 9 performed to date include the Cell 9 bridge crossing over Wells Branch, an access road parallel to Wells Branch, and general grading and filling of wetlands approved under 1997 permits. Construction of Cell 9 is necessary to accommodate the County's waste disposal as the active landfill cell (Cell 8) reaches capacity.

3. PROJECT LOCATION:

a. LOCATION INFORMATION:

A. County: Anne Arundel B. City: Severn C. Name of waterway or closest waterway Wells Branch

D. State stream use class designation: Subbasin 02-13-10 – West Chesapeake Bay Area
Severn Run and all Tributaries = Use Designation IV (Recreation Trout Waters)

E. Site Address or Location: Millersville Landfill and Resource Recovery Facility
389 Burns Crossing Road, Severn, MD 21144

F. Directions from nearest intersection of two state roads:
From the I-97/Route 32 interchange, take Route 32 West toward Odenton. Continue on Route 32 for approximately 2 miles and take the first exit to Burns Crossing Road. Turn right onto Burns Crossing Road, the Department of Public Works office is approximately 1000 feet on the right.

G. Is your project located in the Chesapeake Bay Critical Area (generally within 1,000 feet of tidal waters or tidal wetlands)?:
____ Yes X No

H. County Book Map Coordinates (Alexandria Drafting Co.); Excluding Garrett and Somerset Counties:
Map: 13 Letter: C Number: 3 (to the nearest tenth)

I. FEMA Floodplain Map Panel Number (if known): ____

J. 1. 39°05'27" latitude 2. 76°39'51" longitude

b. ACTIVITY LOCATION: Check one or more of the following as appropriate for the type of wetland/waterway where you are proposing an activity:

A. ____ Tidal Waters
B. ____ Tidal Wetlands
C. ____ Special Aquatic Site (e.g., mudflat, vegetated shallows)
D. X Nontidal Wetland
E. X 25-foot buffer (nontidal wetlands only)
F. ____ 100-foot buffer (nontidal wetland of special State concern)
G. ____ In stream channel
1. ____ Tidal 2. ____ Nontidal
H. ____ 100-year floodplain (outside stream channel)
I. ____ River, lake, pond
J. ____ Other (Explain)

c. **LAND USE:**

A. Current Use of Parcel Is: 1. _____ Agriculture: Has SCS designated project site as a prior converted cropland? _____ Yes _____ No 2. X Wooded 3. _____ Marsh/Swamp 4. _____ Developed 5. _____ Other _____

B. Present Zoning Is: 1. ____ Residential 2. ____ Commercial/Industrial 3. X Agriculture 4. ____ Marina 5. ____ Other

C. Project complies with current zoning X Yes _____ No

THE FOLLOWING INFORMATION IS REQUIRED BY THE STATE (blocks 4-7):

4. REDUCTION OF IMPACTS: Explain measures taken or considered to avoid or minimize wetland losses in F. Also check Items A-E if any of these apply to your project.

A. _____ Reduced the area of disturbance

B. _____ Reduced size/scope of project

C. _____ Relocated structures

D. _____ Redesigned project

E. _____ Other _____

F. Explanation The project will result in minor temporary impacts to wetlands and encroachment of the MDE wetland buffers. Original impacts associated with the perimeter access road were previously permitted by MDE in August, 1997 (WQC 97-NT-0501/199001846) and the U.S. Army Corps of Engineers (USCOE) in June 1997 (CENAB-OP-RW 90-01846-4). Improvements to the 30-foot wide access road will result in minimal impacts to the MDE 25-foot wetland buffer.

Stormwater basin Pond 9-2 and the coastal plain outfall were located in the area between the proposed site for Cell 9 and Wetland 1. The proposed Pond 9-2 and coastal plain outfall are located in an area along Wetland 1 that would result in the least amount of impact to Wetland 1. Alternative site locations of Pond 9-2 and the coastal plain outfall would result in greater impacts to Wetland 1 than the preferred alternative.

Describe reasons why impacts were not avoided or reduced in Q. Also check Items G-P that apply to your project.

G. _____ Cost

H. X Extensive wetlands on site

I. X Engineering/design constraints

J. _____ Other natural features

K. _____ Parcel size

L. X Other regulatory requirement

M. X Failure to accomplish project purpose

N. _____ Safety/public welfare issue

O. _____ Inadequate zoning

P. _____ Other _____

Q. Description Minor temporary impacts to wetlands and encroachment of the MDE wetland buffer were unavoidable due to construction requirements of a 3:1 slope within the required stormwater/sedimentation basin (Pond 9-2) and the standard coastal plain outfall design. Based on site topography, the proposed location of the coastal plain outfall was optimal for drainage from Pond 9-2 into Wetland 1 and Wells Branch. The proposed coastal plain outfall will result in less than 2,000 square feet of temporary impacts to non-tidal wetlands (Wetland 1). Wetland 1 is 5.70 acres and the temporary impact to 0.05 acres is considered to be minor. Construction of Cell 9 is necessary to accommodate the County's waste disposal as the active landfill cell (Cell 8) reaches capacity.

5. LETTER OF EXEMPTION: If you are applying for a letter of exemption for activities in nontidal wetlands and/or their buffers, explain why the project qualifies:

A. _____ No significant plant or wildlife value and wetland impact

1. _____ Less than 5,000 square feet

2. _____ In an isolated nontidal wetland less than 1 acre in size

B. _____ Repair existing structure/fill

C. _____ Mitigation Project

D. _____ Utility Line

1. _____ Overhead

2. _____ Underground

E. Other (explain) _____

F. X Check here if you are **not** applying for a letter of exemption.

IF YOU ARE APPLYING FOR A LETTER OF EXEMPTION, PROCEED TO BLOCK 11

6. ALTERNATIVE SITE ANALYSIS: Explain why other sites that were considered for this project were rejected in M. Also check any items in D-L if they apply to your project. **(If you are applying for a letter of exemption, do not complete this block):**

A. X 1 site B. ____ 2 - 4 sites C. ____ 5 or more sites

Alternative sites were rejected/not considered for the following reason(s):

D. ____ Cost
E. ____ Lack of availability
F. X Failure to meet project purpose
G. ____ Located outside general/market area
H. X Greater wetlands impact
I. ____ Water dependency
J. ____ Inadequate zoning
K. X Engineering/design constraints
L. ____ Other ____

M. Explanation: Construction of Cell 9 is necessary to accommodate the County's waste disposal as the active landfill cell (Cell 8) reaches capacity. Stormwater basin Pond 9-2 and the coastal plain outfall were located in the area between the proposed site for Cell 9 and Wetland 1. The proposed Pond 9-2 and coastal plain outfall are located in an area along Wetland 1 that would result in the least amount of impact to Wetland 1. Due to construction requirements of a 3:1 slope within the required stormwater/sedimentation basin (Pond 9-2), the standard coastal plain outfall design and close proximity of Wetland 1 to the existing access road (location approved in the 1997 MDE and USCOE permits), alternative site locations of Pond 9-2 and the coastal plain outfall would result in greater impacts to Wetland 1 than the preferred alternative.

7. PUBLIC NEED: Describe the public need or benefits that the project will provide in F. Also check Items in A-E that apply to your project. **(If you are applying for a letter of exemption, do not complete this block):**

A. X Economic
B. ____ Safety
C. X Health/welfare
D. ____ Does not provide public benefits
E. ____ Other ____

F. Description Landfilling in Cell 8 began in 1992 and, based on various waste disposal rate scenarios, is expected to reach its permitted capacity sometime between 2014 and 2016. Cell 9 was permitted by MDE in August, 1997 (WQC 97-NT-0501/199001846) and the USCOE in June 1997 (CENAB-OP-RW 90-01846-4). Construction of Cell 9 is necessary to accommodate the County's waste disposal as the active landfill cell (Cell 8) reaches capacity. The Cell 9 area is projected to reach its permitted capacity sometime between 2030 (275,000 tons per year scenario) and 2059 (110,000 tons per year scenario) depending on varied County waste disposal rate scenarios.

8. OTHER APPROVALS NEEDED/GRANTED:

A. Agency	B. Date Sought	C. Decision 1. Granted	2. Denied	D. Decision Date	E. Other Status
Anne Arundel County Conservation District	TBD				

9. MITIGATION PLAN: Please provide the following information:

a. Description of a monetary compensation proposal, if applicable (for **state requirements** only). Attach another sheet if necessary. **(Not Applicable)**

b. Give a brief description of the proposed mitigation project.
Not Applicable. The proposed project will result in less than 2,000 square feet (0.046 acre) of non-tidal wetland loss, therefore, no mitigation for impacts is required.

c. Describe why you selected your proposed mitigation site, including what other areas were considered and why they were rejected. **(Not Applicable)**

d. Describe how the mitigation site will be protected in the future. **(Not Applicable)**

10. HAVE ADJACENT PROPERTY OWNERS BEEN NOTIFIED?: A. _____ Yes B. __X__ No

Provide names and mailing addresses below (Use separate sheet, if necessary):

a. SEE ATTACHED LIST b. _____ c. _____

11. HISTORIC PROPERTIES: Is your project located in the vicinity of historic properties? (For example: structures over 50 years old, archeological sites, shell mounds, Indian or Colonial artifacts). Provide any supplemental information in Section 13.

A. _____ Yes B. __X__ No C. _____ Unknown

12. ADDITIONAL INFORMATION: Use this space for detailed responses to any of the previous items. Attach another sheet if necessary:

Check box if data is enclosed for any one or more of the following (see checklist for required information):

A. _____ Soil borings
B. __X__ Wetland data sheets
C. __X__ Photographs
D. __X__ Field surveys
E. _____ Alternate site analysis
F. _____ Market analysis
G. __X__ Site plan
H. _____ Avoidance and minimization analysis

I. X Other (explain) Attachment 1: Project Location and Study Area Map

Attachment 2: Project Drawings

Attachment 3: Wetland Identification and Delineation Report (2007)

Attachment 4: List of Adjacent Property Owners

CERTIFICATION:

I hereby designate and authorize the agent named above to act on my behalf in the processing of this application and to furnish any information that is requested. I certify that the information on this form and on the attached plans and specifications is true and accurate to the best of my knowledge and belief. I understand that any of the agencies involved in authorizing the proposed works may request information in addition to that set forth herein as may be deemed appropriate in considering this proposal. I certify that all Waters of the United States have been identified and delineated on site, and that all jurisdictional wetlands have been delineated in accordance with the Federal Manual for Identifying and Delineating Jurisdictional Wetlands. I grant permission to the agencies responsible for authorization of this work, or their duly authorized representative, to enter the project site for inspection purposes during working hours. I will abide by the conditions of the permit or license if issued and will not begin work without the appropriate authorization. I also certify that the proposed works are consistent with Maryland's Coastal Zone Management Plan. I understand that none of the information contained in the application form is confidential and that I may request that additional required information be considered confidential under applicable laws. I further understand that failure of the landowner to sign the application will result in the application being deemed incomplete.

LANDOWNER MUST SIGN: Stephen J. Kyciski DATE: 1/28/08

WHERE TO MAIL APPLICATION

Maryland Department of the Environment
Water Management Administration
Regulatory Services Coordination Office
1800 Washington Boulevard, Suite 430
Baltimore, Maryland 21230
Telephone: (410) 537-3762
1-800-876-0200

BEFORE YOU MAIL... DON'T FORGET...

- **SIGN AND DATE THE APPLICATION. THE LANDOWNER MUST SIGN.**
- **FIVE (5) COPIES OF ALL DOCUMENTS (APPLICATION, PLANS, MAPS, REPORTS, ETC.) MUST BE RECEIVED TO BEGIN OUR REVIEW.**
- **INCLUDE FIVE COPIES OF A VICINITY MAP (LOCATION MAP) WITH THE PROJECT SITE PINPOINTED.**

SAMPLE PLANS MAY BE OBTAINED BY PHONE (1-800-876-0200)
OR E-MAIL acunabaugh@mde.state.md.us.

SUPPLEMENTARY INFORMATION TO BE INCLUDED ON PLANS, DRAWINGS, OR VICINITY MAPS

In addition to the information indicated on the previous pages, you should include the following on the 8 1/2 x 11 site plans and any blueprints you have submitted:

1. Delineation of any wetland buffers or expanded buffers, clearly marked and differentiated.

2. Location of mitigation area, if proposed on the same site as the project.

Note: If you are proposing a complex project you may wish to submit engineering blueprints of your project with the application form to expedite review.

Mitigation Location Map: If you are proposing that nontidal wetland mitigation be done at a different location than the proposed project, you should submit a map showing the location of the mitigation site in relation to the proposed nontidal wetland losses.

WETLAND DELINEATION

Wetlands should be identified according to methods described in the publication Federal Manual Identifying and Delineating Jurisdictional Wetlands. Copies of the manual may be obtained by calling the U. S. Government Printing Office at 202-783-3238 and requesting document #024-010-00-683-8 at a cost of $7.50. Wetlands must be shown on all plans submitted with the application. All wetlands on site must be delineated and shown on the overall site plan. 8½ x 11 inch plans with topography showing relation of the wetlands and project impacts must be submitted. Copies of the wetland reports and data sheets used in making the determination be included with your application submittal.

Project Description

The Anne Arundel County Department of Public Works has proposed to begin construction of additional facilities that are needed to support Cell 9 at the Millersville Landfill and Resource Recovery Facility (herein referenced as the MLFRRF) on Burns Crossing Road in northern Anne Arundel County, Maryland. The MLFRRF waste disposal Cell 8 was permitted by Maryland Department of the Environment (MDE) in the early 1990's. Landfilling in Cell 8 began in 1992 and based on various waste disposal rate scenarios developed by Anne Arundel County – Waste Management Services (AAC-WMS), the Cell 8 area is expected to reach its permitted capacity sometime between 2014 and 2016.

The MLFRRF waste disposal Cell 9 was permitted by MDE in August, 1997 (WQC 97-NT-0501/199001846) and the U.S. Army Corps of Engineers (USCOE) in June 1997 (CENAB-OP-RW 90-01846-4). Construction activities of Cell 9 performed to date include the Cell 9 bridge crossing over Wells Branch, an access road parallel to Wells Branch, and general grading of wetlands approved under 1997 permits.

Construction of Cell 9 is necessary to accommodate the County's waste disposal as the active landfill cell (Cell 8) reaches capacity. The proposed project will include the construction of Cell 9, a stormwater/sedimentation pond (Pond 9-2) with a discharge into Wells Branch, and a soil stockpile/borrow area. Cell 9 is a double-lined disposal area, approximately 84 acres in size. The Cell 9 area is projected to reach its permitted capacity sometime between 2030 (275,000 tons per year scenario) and 2059 (110,000 tons per year scenario) depending on varied County waste disposal rate scenarios.

Purpose

The purpose of this report is to describe wetland and waterways investigations performed within the proposed project study areas. This report was prepared in part to satisfy the regulatory requirements of the U.S. Army Corps of Engineers (USCOE), which has jurisdictional authority over wetlands and waterways of the United States under the purview of Section 404 of the Clean Water Act, and the Maryland Department of the Environment (MDE) which has authority over wetlands and waterways under the Non-tidal Wetlands Protection Act & Program and the Waterway Construction Statute.

Study Area Description

The project study area is approximately 125 acres dominated by deciduous forest (Figure 1). The proposed Cell 9 area borders existing Cell 8 and combined Cells 5-6-7. The proposed project study area is located in the Western Shore Uplands Region of the Coastal Plain Province of Maryland (MGS, 2001).

One USGS mapped intermittent stream, Wells Branch, is located within the project study area (Figure 2). At the MLFRRF, surface water flows into Wells Branch from stormwater runoff from undeveloped areas, wetland seeps and outfalls from sediment basins, ponds and traps. Upon leaving the MLFRRF property, Wells Branch flows east to the confluence with Severn Run, which, in turn, flows into the Severn River. Topography along the project study area alignment is rolling with elevations ranging between 80 feet above mean sea level along the floodplain of Wells Branch to approximately 240 feet along the southern border of the project study area. Located within the floodplain of Wells Branch, one palustrine forested broad-leaf deciduous, seasonal wetland (PFO1C) is identified on the USFWS National Wetlands Inventory (NWI) mapping (Figure 3).

Scale: 1 inch = approximately 2300 feet

Figure 3. National Wetlands Inventory (NWI) Map.
Source: U.S. Fish and Wildlife Service. NWI Wetlands Online Mapper. Accessed October 17, 2007. http://wetlandsfws.er.usgs.gov/wtlnds/launch.html
Scale: 1 inch = approximately 1000 feet

The floodplain forest along Wells Branch is dominated by red maple (*Acer rubrum*), black gum (*Nyssa sylvatica*), tulip poplar (*Liriodendron tulipifera*), and willow oak (*Quercus phellos*). The shrub layer was dominated by sweet pepperbush (*Clethra alnifolia*), sweetbay magnolia (*Magnolia virginiana*), American holly (*Ilex opaca*), winterberry (*Ilex verticillata*) and highbush blueberry (*Vaccinium corymbosum*). Common greenbrier (*Smilax rotundifolia*), Asiatic tearthumb (*Polygonum perfoliatum*), and microstegium (*Microstegium viminea*) where the common vines and herbs.

The upland forest is dominated by red maple, tulip poplar, pitch pine (*Pinus rigida*), chestnut oak (*Quesrcus prinus*), red oak (*Quercus rubra*), white oak (*Quercus alba*), black oak (*Quercus nigra*) and black cherry (*Prunus serotina*). The shrub layer was dominated by American holly and highbush blueberry. Extensive deer-browse limited the growth of vines and herbs within the upland forest community.

Soil series were identified through a review of the USDA Natural Resources Conservations Service Web Soils Survey for Anne Arundel County (USDA, 2007). Soils mapped within the project study area include Downer-Hammonton complex (DvB, DvC and DvD), Downer-Phalanx complex (DxC and DxD), Evesboro and Galestown soils (EVC), Sassafras fine sandy loam (SaB), Sassafras-Hambrook complex (ShA), Sassafras and Croom soils (SME and SMF), Udorthents, refuse substratum (UfG) and Woodstown sandy loam (WdB). None of soils are listed as hydric soils at the federal, state or local level (Figure 4).

Soil Name	Soil Map Unit	Acres in Study Area	National, State or Local Hydric Soils List
Downer-Hammonton Complex	DvB, DvC, DvD	42.8	Not Listed
Downer-Phalanx Complex	DxC, DxD	18.1	Not Listed
Evesboro and Galestown Soils	EVC	1.9	Not Listed
Sassafras Fine Sandy Loam	SaB	18.7	Not Listed
Sassafras-Hambrook Complex	ShA	<0.1	Not Listed
Sassafras and Croom Soils	SME, SMF	30.6	Not Listed
Udorthents, Refuse Substratum	UfG	0.6	Not Listed
Woodstown Sandy Loam	WdB	1.6	Not Listed
Zekiah and Issue Soils	ZBA	11.1	Not Listed

Scale: 1 inch = approximately 800 feet

Methods

The study area was investigated for palustrine wetland indicators of vegetative composition, soil development and hydrology. The investigation was conducted in accordance with the *Corps of Engineers Wetlands Delineation Manual* (Environmental Laboratory, 1987). Due to the size and characteristics of the study area, the Routine-On-Site Determination method was used. If present, wetlands within and directly adjacent to the limits of proposed work were delineated so that their presence could be shown on project mapping to aid in impact avoidance during engineering design.

Soils were characterized by evaluating the upper horizons of the soil profile. Soil pits were dug using a "sharpshooter" spade with a 14-inch blade. Soil horizons were evaluated using normal field protocols for determining texture and nomenclature. The *Munsell Soil Color Charts* (Macbeth Division of Kollmorgen

Instruments Corporation, 1994) were used to determine the colors of horizons and redoximorphic features. Reducing condition determinations in soils were performed in the field using presence/absence of mottles, low chroma colors and presence of concretions.

Data point locations were investigated for primary and secondary wetland hydrology indicators. If present, wetland boundaries were marked using pink wetland flagging. Wetland boundary data points were located using a Trimble ™ ProXR®Global Positioning System (GPS). The Trimble ™ ProXR® is capable of attaining sub-meter accuracy (Trimble, 1997). The GPS data were then transferred onto relevant site mapping using the U.S. State Plane, 1927, Maryland coordinate system. Wetlands were identified on site base mapping to show their proximity to the proposed construction areas. Classifications were assigned to each wetland following the Cowardin et al methods (1979). Color photographs were taken of all relevant features to document site conditions during the time of the investigations.

Vegetation was identified using *A Field Guide to Trees and Shrubs* (Petrides 1986), *Newcomb's Wildflower Guide* (Newcomb 1977) and *Grasses An Identification Guide* (Brown 1979). Plant species were assigned an indicator status [e.g., Upland (UPL), Facultative Upland (FACU), Facultative (FAC), Facultative Wetland (FACW), or Obligate Wetland (OBL) based on the USFWS's *National List of Plant Species that Occur in Wetlands: 1988 National Summary* (Reed 1988).

Wetland function and value assessments were performed at each wetland location (if present) using the methods outlined in *The Highway Methodology Workbook Supplement, Wetland Functions and Values A Descriptive Approach*, USCOE New England Division (NEDEP-360-1-30a 1995). Wetland functions were evaluated and recorded using the standard wetland function-value evaluation form.

Waterways (if present) were identified through a review of available mapping and field investigations. Topographic and engineering maps were reviewed for the presence of streams within the project area. Field investigations for waterways were performed in conjunction with the wetland field investigation and included the field verification of mapped watercourses and the identification and delineation of streams, springs, and seeps that were not shown on existing engineering plans. Waterways were identified by the presence of bed and banks and/or ordinary high water marks. The flow regime of each identified waterway was characterized based upon field indicators of hydrologic, floral, and faunal character at the time of the investigation. All identified waterways were located using GPS and photographed.

Results

Wetlands: The study area was field investigated for palustrine wetland indicators of vegetative composition, soil development, and hydrologic characteristics on October 15th and 16th, 2007. Weather conditions were warm, clear and dry with temperatures ranging between 65 and 80°F. Preliminary precipitation data indicated no rainfall for the Baltimore area 48-hours prior to the investigation.

Two wetlands were identified within the project study area. Wetland 1 (5.70 acres) was a palustrine forested wetland (PFO) located within the floodplain of Wells Branch. The tree canopy was dominated by red maple (*Acer rubrum*), black gum (*Nyssa sylvatica*), tulip poplar (*Liriodendron tulipifera*), and willow oak (*Quercus phellos*). The shrub layer was dominated by sweet pepperbush (*Clethra alnifolia*), sweetbay magnolia (*Magnolia virginiana*), American holly (*Ilex opaca*), winterberry (*Ilex verticillata*) and highbush blueberry (*Vaccinium corymbosum*). Common greenbrier (*Smilax rotundifolia*), Asiatic

tearthumb (*Polygonum perfoliatum*), and microstegium (*Microstegium viminea*) were the common vines and herbs. Primary hydrologic indicators included inundation and saturated soils in places, drainage patterns and drift lines. Secondary indicators included oxidized root channels, water-stained leaves and buttressed tree roots. Soil samples at various locations throughout Wetland 1 were primarily a sandy silt loam with low-chroma and mottling. Soils of Wetland 1 were hydric.

Wetland 2 (0.17 acres) was a small palustrine forested wetland (PFO) located within the floodplain of Wells Branch near the eastern limit of the project study area. The tree canopy was dominated by red maple, black gum, and white oak (*Quercus alba*). The shrub layer was dominated by sweetbay magnolia and American holly. Microstegium dominated the herbaceous layer within Wetland 2. Primary hydrologic indicators included saturated soils and drainage patterns. Soils were primarily a silty sand with low-chroma and mottles. Soils of Wetland 2 were hydric.

Waterways: Wells Branch was confirmed in the field. Wells Branch ranged in width between three and eight feet within the project study area with an average width of five feet. The western half of Wells Branch located within the project study area was poorly defined in places, reverting to overland flow before becoming channelized several hundred feet downstream. With an average width of three feet, the top of bank of the western half of Wells Branch varied between three inches and two feet above the streambed. The stream substrate was predominantly sand. Intermittent flow was only observed within the western half of the study area. Approximately 70% of Wells Branch located within the project study area exhibited no flow and no standing water during the investigation. During the investigation, Wells Branch exhibited no flow east (downstream) of wetland flag W1-101 (See Appendix A).

The eastern half of Wells Branch was highly channelized as the combined discharge of several stormwater ponds (Ponds 3, 4 and 5) increased erosion of the sandy alluvial soils of the floodplain. With an average width of six feet, the top of bank of the eastern half of Wells Branch varied between two feet and four feet above the streambed. The stream substrate was predominantly sand. The streambanks of the eastern half of Wells Branch exhibited considerable erosion and undercutting and exhibited no flow during the investigation.

Several small spring/seeps were identified within the limits of Wetland 1, located between wetland flags W1-13 and W1-27. The small channels created by the spring/seeps were not well defined, were less than two feet wide and the water level averaged less than one inch deep during the investigations. One additional spring/seep, not associated with a wetland, was mapped and photographed.

Summary

Field investigations conducted by Gannett Fleming, Inc. on October 15th and 16th, 2007 to identify and delineate wetlands and waterways within the project study area were conducted in accordance with the 1987 U.S. Army Corps of Engineers Wetlands Delineation Manual. Wells Branch was confirmed in the field. Intermittent flow was only observed within the western half of the study area. Although no flow was observed during the investigations, the eastern half of Wells Branch was highly channelized as the combined discharge of several stormwater ponds (Ponds 3, 4 and 5) increased erosion of the sandy alluvial soils of the floodplain. Two palustrine forested wetlands were identified and mapped adjacent to Wells Branch. Several small spring/seeps were identified within the limits of Wetland 1. The small channels created by the spring/seeps were not well defined. One additional spring/seep, not associated with a wetland, was identified and mapped as part of the investigation.

Wetland ID	Cowardin Classification	Wetland Size (acres)
Wetland 1	PFO	5.70
Wetland 2	PFO	0.17

Stream ID	Flow Regime	Stream Width (feet)
Wells Branch	Intermittent	5.0

✓	**Gleyed or Low-chroma Color**		**Other (Explain in Remarks)**

Remarks:

WETLAND DETERMINATION			
Is Hydrophytic Vegetation Present?	Yes	**Is The Sampling Point Within A Wetland?**	Yes
Is Wetland Hydrology Present?	Yes		
Are Hydric Soils Present?	Yes		

Remarks:

Location of Sampling Point: This sampling point is located within the floodplain of Wells Branch.

APPENDIX D
FUNCTION AND VALUE SHEETS

Wetland 1

Wetland Function-Value Evaluation Form

Total Area of Wetland 5.70 acres Human made? No Is wetland part of a wildlife corridor? Yes Or a "habitat island"? No

Adjacent land use Active Landfill and Deciduous Forest

Distance to nearest road or development is 50 ft

Dominant wetland system present is PFO Is a Contiguous undeveloped buffer zone present? Yes

Is the wetland a separate hydraulic system? No If not, where does the wetland lie in the drainage basin? Middle

How many tributaries contribute to the wetland? One, Wells Branch

Wetland ID: Wetland 1

Prepared by: Steve Smith, GF

Wetland impact:
Type: unknown Area: unknown

Evaluation based on:
Office No Field Yes

Corps manual wetland delineation completed? Yes

Function/Value	Suitability Y	Suitability N	Rationale (Reference #)	Principal F/V	Comments
Groundwater Recharge/Discharge	X		4, 7, 13		Several spring/seeps were observed within the limits of Wetland 1. Groundwater expression observed in the upstream portion of Wells Branch disappeared underground within the limits of Wetland 1 and did not provide enough hydrology to maintain flow throughout the extent of Wells Branch located within the project study area.
Floodflow Alteration	X		5, 6, 8, 9, 10, 13, 14, 18	X	Wetland 1 is a large wetland located within the floodplain of Wells Branch has significant floodflow alteration potential based on its small area.
Fish and Shellfish Habitat		X			Wells Branch provides limited fish habitat in places but Wetland 1 does not.
Sediment/Toxicant Retention	X		1, 2, 10, 16		Wetland along Wells Branch carries runoff from the adjacent landfill. Erosion of the Wells Branch stream channel through portions of Wetland 1 is severe.
Nutrient Removal		X			
Production Export		X			
Sediment/Shoreline Stabilization	X		1, 3, 4, 5 (in places), 6 (in places), 7, 9, 12, 14, 15		Wetland along Wells Branch carries runoff from the adjacent landfill. Erosion of the Wells Branch stream channel through portions of Wetland 1 is severe.
Wildlife Habitat	X		3, 5, 6, 7, 8, 13, 15, 17		Deer and multiple bird species were observed within Wetland 1.
Recreation		X			
Educational/Scientific Value		X			
Uniqueness/Heritage		X			
Visual Quality/Aesthetics		X			
ES Endangered Species Habitat		X			
Other		X			

Wetland 2

Wetland Function-Value Evaluation Form

Total Area of Wetland 0.17 acres Human made? No Is wetland part of a wildlife corridor? Yes Or a "habitat island"? No

Adjacent land use Active Landfill and Deciduous Forest

Distance to nearest road or development is 200 ft

Dominant wetland system present is PFO Is a Contiguous undeveloped buffer zone present? Yes

Is the wetland a separate hydraulic system? No If not, where does the wetland lie in the drainage basin? Middle

How many tributaries contribute to the wetland? One, Wells Branch

Wetland ID: Wetland 2

Prepared by: Steve Smith, GF

Wetland impact:
Type: unknown Area: unknown

Evaluation based on:
Office No Field Yes

Corps manual wetland delineation completed? Yes

Function/Value	Suitability Y	Suitability N	Rationale (Reference #)	Principal F/V	Comments
Groundwater Recharge/Discharge		X			
Floodflow Alteration	X		5, 9, 10, 13		Small wetland located within the floodplain of Wells Branch has limited floodflow alteration potential based on its small area.
Fish and Shellfish Habitat		X			
Sediment/Toxicant Retention	X		1, 2, 10		Wetland along Wells Branch carries runoff from the adjacent landfill. Erosion of the Wells Branch stream channel adjacent to Wetland 2 is severe. Wetland 2 has limited potential to retain sediment and toxins based on its small size.
Nutrient Removal		X			
Production Export		X			
Sediment/Shoreline Stabilization		X

Re: AI Number: 19044
Nontidal Wetlands and Waterways Application Number:
13-NT-0253/201361335
Response Due Date: October 31, 2013

Dear Ms. Broersma,

Vanasse Hangen Brustlin, Inc. (VHB) and SCS Engineers submits these responses to the comments we received from your office on September 11, 2013. The comments are provided below, each followed by our responses.

Additional Information Required to Complete the Application

1. There are discrepancies between the nontidal wetlands impact figures on pages two and three of the application. Plan sheets #3 and #4 correlate with the impact figures shown on page three of the application. Please provide a table with the actual, proposed impacts to wetlands, in square feet.

   Response: You are correct in that page two of the application contained inconsistent impact numbers. We have revised this page of the application and it is included as an attachment to this package. Page three of the application and the plan sheets #3 and #4 are correct. The following table is provided to clarify the proposed wetland impacts:

Sheet Number	Impact Description	Area (Sq. ft.) or Linear Feet of Impact
3	PFO wetland	1,204 sq. ft.
3	PFO wetland	4,118 sq. ft.
3	PFO wetland	2,950 sq. ft.
3	PFO wetland	253 sq. ft.

351 McLaws Circle, Suite 3
Williamsburg, Virginia 23185-6316
757.220.0500 ▪ FAX 757.220.8544
email: info@vhb.com
www.vhb.com

3	PFO wetland	783 sq. ft.
3	Wetland buffer	7,044 sq. ft.
3	Wetland buffer	16,415 sq. ft.
3	Wetland buffer	5,202 sq. ft.
3	Wetland buffer	2,664 sq. ft.
3	Wetland buffer	3,945 sq. ft.
3	Stream impact	115 l.f.
3	Stream impact	32 l.f.
3	Stream impact	54 l.f.
4	PFO wetland	852 sq. ft.
4	Wetland buffer	2,905 sq. ft.
Totals	**Stream Impacts**	**201 l.f.**
	Wetland PFO Impacts	**10,160 sq. ft.**
	Wetland Buffer Impacts	**38,175 sq. ft.**

2. The project must be advertised on public notice for the opportunity to comment and/or request a public informational hearing. Please complete, sign and return the enclosed Billing Approval Form.

   Response: We have completed the Billing Approval Form and it is attached for your use.

3. Provide a complete set of the 8 ½ by 11 – inch plans sheets, including a vicinity map, with the project tracking numbers found on page 1 of this letter printed on each sheet. These plan sheets will be used in the public notice.

   Response: The original 8 ½ x 11 –inch plans have been updated to include the tracking numbers per your request.

4. The pre-printed address labels do not include local government officials. Please provide two additional label sets that include the Anne Arundel County Executive, the District Legislators and Senator and the County Council representative.

   Response: Attached please find two address label sets that include the requested government officials.

5. Please provide a list of all adjacent property owners and local government officials in an electronic format for inclusion in our database.

   Response: A CD is enclosed that contains a Word file listing the adjacent property owners and local government officials.

6. It is unclear from the provided plans if the connector road impacts regulated areas at its intersection with the perimeter road, please quantify if applicable.

   Response: We have included an additional plan sheet 3A that shows the area south of the above-mentioned intersection. There are no wetland impacts in this area.

7. Please provide a full sized set of sketch/grading plans if available.

   Response: As discussed, we are submitting one (1) full-size copy of the current grading plan (Sheet 4 of 61) associated with Cell 9.1. We have also placed a PDF of this grading plan on the enclosed CD.

8. What year was pond 9-2 constructed?

   Response: Construction was complete on January 20, 2012.

9. Additional information is required for the alternatives analysis. The Applicant must consider alternative site design(s) that would avoid and/or minimize impacts to regulated areas for the Division to review and include in our final Permit decision. For example, how large is the County landfill property? Will additional land be purchased to increase the size of the property? How much of the property is undeveloped? What is the area of the property that is unsuitable for development? Are additional cells planned in the future? What are the environmental and/or other constraints associated with relocation of Cell #9? This list is not all inclusive and any additional information that you can provide will help in our permitting process.

   Response: Alternative site design analyses for Cell 9 of Millersville were conducted between 1991 and 1994 by various consultants including GeoSyntec Consultants, Greenhorne & O'Mara, and Hogan Environmental. The findings were documented and presented as part of the Phase III Permit Application documents that were submitted to MDE in 1994. MDE reviewed and ultimately approved the Cell 9 design documents in 1994. These reports, along with a summary of the current status of the Cell 9 design, is provided in the attached document entitled "Alternative Analyses Summary for Millersville Landfill and Resource Recovery Facility." This document, and the report attached thereto, provide the information requested in your comment number 9.

We trust that these responses satisfy your original request and permit you to move forward with the advertisement/notification process. Should you have any questions or need additional information, please contact me at 757-220-0500.

Very Truly Yours,

VANASSE HANGEN BRUSTLIN, INC.

Chris Frye
Senior Project Manager

Re: Tracking #: 201361335/13-NT-0282
AADPW/Millersville Landfill, Cell 9/Repair and Maintenance
Initial Waterway/Floodplain Review Comments

Dear Ms. Flint,

Vanasse Hangen Brustlin, Inc. (VHB) submits these responses to the comments we received from your office on September 9, 2013. The comments are provided below, each followed by our responses.

1. On page 4 of 7 of the Phase I Mitigation Plan, the text states that the site stream restoration project will easily compensate site impacts as well as all stormwater-related requirements. What specific stormwater related requirements will be met by the restoration? Please show the breakdown of what quantity of the stream restoration will meet the mitigation for stream impacts and what quantity of the stream restoration will meet which specific stormwater management requirements.

   Response: Project stormwater management requirements for the construction of Cell 9.1 of the Millersville Landfill were taken from the Stormwater Management Report for Milersville Landfill, Cell 9 developed by McCrone, Inc. in April of 2000. The report identifies 10.2 acres of impervious area that is being treated by stormwater pond 9.2. Under the current design for Cell 9, 9.24 acres of perimeter, connector, interior roads and crossovers are proposed (refer to attached worksheet for Impervious Area calculations for 2013 design). The current design includes an additional 4.6 acres for a recycling pad. Therefore, the total impervious area that needs to be treated is the 3.64 acres (13.84 acres proposed - 10.2 acres treated by pond 9-2) of project requirements that was not previously treated. The stream restoration of 1750 linear feet of degraded stream along Wells Branch has been proposed to provide for the remaining stormwater management requirements, as well as provide mitigation for wetland and stream

351 McLaws Circle, Suite 3
Williamsburg, Virginia 23185-6316
757.220.0500 : FAX 757.220.8544
email: info@vhb.com
www.vhb.com

impacts associated with Cell 9.1 development. Using MDE's June 2011 guidance in Accounting for Stormwater Wasteload Allocations, 100 linear feet of stream restoration can have an equivalent treatment of 1 acre of impervious area. Using this guidance, approximately 364 linear feet of the 1750 linear feet of restored stream would be allocated to meet project stormwater management requirements. 235 feet of restored stream will be allocated as mitigation for the 201 feet of impacts associated with development of Cell 9.1, leaving 1,151 linear feet of restored stream that would be available for other County goals.

2. What will happen to the existing culvert under the existing perimeter road during construction of the new perimeter road alignment and during filling of the Cell 9? If the culvert will remain please provide a profile of the culvert to scale to show the proposed conditions at this crossing.

   Response: Two existing CMP culverts will be removed concurrent with perimeter road construction. A new 24" CMP culvert will be provided under the perimeter road for diversion of clear water from the west side of the proposed recycling area. When landfill development eventually proceeds into this area, the 24" CMP will be removed or abandoned. Attached please find Sheet 6 of 61 of the landfill design plans that identifies the location of the proposed 24" CMP. Inv. In = 142.0' and the Inv. Out = 131.0.

3. Please provide specifications per COMAR 26.17.04.07 (A5&6), which includes a minimum of:
   a. The sequence of construction,
   b. A means for diverting stream flow during construction,
   c. A means for controlling the dewatering discharges,
   d. A means for controlling runoff during the various construction phases.

   Please refer to Maryland's Waterway Construction Guidelines.
   http://www.mde.state.md.us/Programs/WaterPrograms/Wetlands_Waterways/documents_information/guide.asp

   Response: The Phase II mitigation plans will incorporate these specifications.

4. The project has been forwarded to the Maryland Historical Trust due to an application screening "hit" by the Permit Service Center. Any comments received will be forwarded for your consideration.

   Response: Please forward any comments you may receive from MHT.

5. Please submit the Phase II Mitigation Plan as a separate Joint Permit Application for the State.

   Response: We are preparing the Phase II mitigation plan and should be providing that in the near future.

6. Please refer to COMAR 26.17.04.07, Changes in Stream Channels or Floodplains for guidance on some of the documentation that will be required as part of the Phase II Mitigation Plan.

   Response: We will be reviewing the referenced section of COMAR as we develop the Phase II mitigation plan and associated documentation needed.

I trust these responses will satisfy your current comments and we look forward to working with you during the review of the Phase II mitigation plans. Should you have any questions or need additional information, please contact me at 757-220-0500.

Very Truly Yours,

Re: Tracking #: 13-NT-0282/201361335
AADPW/Millersville Landfill, Cell 9
Initial Nontidal Wetland Mitigation Review Comments

Dear Mr. Tiralla,

Vanasse Hangen Brustlin, Inc. (VHB) submits these responses to the comments we received from your office on September 9, 2013. The comments are provided below, each followed by our responses.

1. On page 4 of 7 of the Plan, the text states that "the on-site stream restoration project…will easily compensate site impacts as well as all stormwater-related requirements." Are any stormwater-related requirements, or any other requirements (e.g. Forest Conservation Act, TMDL, etc.), being satisfied through the proposed wetland restoration/creation? If so please identify the additional requirements and quantify the associated wetland credits being proposed to satisfy them.

   Response: Project stormwater management requirements for the construction of Cell 9.1 of the Millersville Landfill were taken from the Stormwater Management Report for Milersville Landfill, Cell 9 developed by McCrone, Inc. in April of 2000. The report identifies 10.2 acres of impervious area that is being treated by stormwater pond 9.2. Under the current design for Cell 9, 9.24 acres of perimeter, connector, interior roads and crossovers are proposed (refer to attached worksheet for Impervious Area calculations for 2013 design). The current design includes an additional 4.6 acres for a recycling pad. Therefore, the total impervious area that needs to be treated is the 3.64 acres (13.84 acres proposed - 10.2 acres treated by pond 9-2) of project requirements that was not previously treated. The stream restoration of 1750 linear feet of degraded stream along Wells Branch has been proposed to provide for the remaining stormwater

email: info@vhb.com
www.vhb.com

management requirements, as well as provide mitigation for wetland and stream impacts associated with Cell 9.1 development. Using MDE's June 2011 guidance in Accounting for Stormwater Wasteload Allocations, 100 linear feet of stream restoration can have an equivalent treatment of 1 acre of impervious area. Using this guidance, approximately 364 linear feet of the 1750 linear feet of restored stream would be allocated to meet project stormwater management requirements. 235 feet (includes 17% contingency) of restored stream will be allocated as mitigation for the 201 feet of impacts associated with development of Cell 9.1, leaving 1,151 linear feet of restored stream that would be available for other County goals.

With respect to the wetland impacts and mitigation, using a 2:1 ratio for PFO wetland impacts the wetland mitigation requirement associated with cell 9.1 development is 0.46 acres of wetland creation/restoration. The Wells Branch restoration project will provide wetland creation/restoration in excess of that requirement to insure the success of the site. Excess wetland creation will not be applied towards any other requirement. A final table showing all accounting will be provided in the Phase II plans.

2. On page 4 of 7 of the Plan, the text states that "Of this cumulative 0.986 acres of wetland creation, 0.09 acres will not be applied to the mitigation requirement to compensate for existing wetlands along the corridor that will be converted or otherwise impacted based on site construction." All nontidal wetland impacts associated with the wetland mitigation construction are exempt from MDE permit requirements. However, all permanent nontidal wetland impacts need to be quantified and called out on the plan sheets, along with a breakdown of how much of the wetland restoration/creation credits are being used to offset the impacts.

   Response: All permanent non-tidal impacts associated with landfill expansion and including mitigation are called out on the plan sheets. PFO wetland impacts totaling 0.23 acres will be mitigated for on-site through the creation/restoration of a minimum of 0.46 acres of PFO wetlands adjacent to the Wells Branch restoration reach. The implementation of the stream and wetland restoration will include unavoidable impacts (permanent and temporary) to existing wetlands and stream. These impacts have been minimized to the greatest extent possible through the design process, but are necessary to provide the most stable system for that setting. The permanent wetland impact areas were summed (the 0.09 acres documented in the Phase I Mitigation Plan) and subtracted from the total wetland creation/restoration area as to not constitute "double-dipping" of credits. These areas will be appropriately accounted for and called out on the plan set submitted with the Phase II Mitigation Plan, including all permanent and temporary impacts.

3. The protection mechanism example included in the application as Attachment H appears to be incomplete and/or inadequate. The most current MDE/USACE approved Declaration of Restrictive Covenants should be used as the basis for developing an acceptable protection mechanism. This document can be found on the USACE website at: http://www.nab.usace.army.mil/Portals/63/docs/Regulatory/Mitigation/Permittee_Resp_Mit_Site_Dec.pdf

   Response: The County will provide a protection mechanism covering the proposed project that follows the format of the referenced document. The County is currently conducting a legal review of the referenced document, that was downloaded from the USACE website. Additional information will be submitted with the Phase II Mitigation Plan.

4. The Performance Standards found on page 6 of 7 of the Plan should include, at a minimum, MDE's most recent language for performance standards to be achieved after 5 years from the completion of the mitigation project. The most recent language is as follows: (listed out).

   Response: This language will be included with the Wells Branch Post Construction Monitoring Plan included with the submittal of the Phase II Mitigation Plan.

5. On page 7 of 7 of the Plan, under the Monitoring Requirements, the text states that "A Post construction Monitoring Plan will be submitted for the restoration site to document the full scale of monitoring activities conducted to document site success." The aforementioned, detailed Monitoring Plan should be included as part of the Phase II Wetland Mitigation Plan. MDE's MONITORING PROTOCOL FOR WETLAND MITIGATION PROJECTS has been attached hereto as Exhibit A for your information. It includes minimum monitoring requirements, as well as recommended data collection techniques for meeting the monitoring requirements.

   Response: All monitoring requirements and approved success criteria will be included with the Phase II Mitigation Plan submittal.

I trust these responses will satisfy your current comments and we look forward to working with you during the review of the Phase II mitigation plans. Should you have any questions or need additional information, please contact me at 757-220-0500.

2. PROJECT DESCRIPTION **(SECTION B REVISED 10/11/13)**

a. GIVE WRITTEN DESCRIPTION OF PROJECT:

Construction of Cell 9 is necessary to accommodate the County's waste disposal as the active landfill cell (Cell 8) reaches capacity. The proposed project will include the construction of Cell 9, a stormwater/sedimentation pond (Pond 9-2) with a discharge into Wells Branch and a soil stockpile/borrow area. Cell 9 is a double-lined disposal area, approximately 84 acres in size. The Cell 9 area is projected to reach its permitted capacity sometime between 2030 (275,000 tons per year scenario) and 2059 (110,000 tons per year scenario) depending on varied County waste disposal rate scenarios. The revised landfill design includes a permanent connector road at the western end of Cell 9 that links directly with the main entrance and scale house. The existing grades along this alignment are too steep (15-20% slope), so in order to improve safety the perimeter road grades and landfill rim would be raised in elevation to provide more manageable roadway grades (3-8%) through the connector road route. This additional permanent connection provides redundancy in the access to Cell 9 and flexibility in routing landfill traffic.

Has any portion of the project been completed? X Yes ____ No If yes, explain ____

The Millersville site waste disposal Cell 9 was permitted by MDE in August, 1997 (WQC 97-NT-0501/199001846) and the U.S. Army Corps of Engineers (COE) in June 1997 (CENAB-OP-RW 90-01846-4). Construction activities of Cell 9 performed to date include the Cell 9 bridge crossing over Wells Branch, an access road parallel to Wells Branch, general grading of wetlands approved under 1997 permits, and stormwater pond 9-2 approved under 2008 permits (MDE 08-NT-0026/200860367; COE MD SPGP-3).

Is this a residential subdivision or commercial development? ____ Yes X No

If yes, total number of acres on property ____ acres

MDE Wetlands Permit Package Resubmittal - Alternatives Analysis (2013)

ALTERNATIVES ANALYSES SUMMARY
FOR
MILLERSVILLE LANDFILL AND RESOURCE RECOVERY FACILITY
ANNE ARUNDEL COUNTY, MARYLAND

Prepared by
SCS ENGINEERS

OCTOBER 16, 2013

BACKGROUND

Information provided by Anne Arundel County indicates that the Millersville Landfill and Resource Recovery Facility (previously known as the Millersville Sanitary Landfill) began waste disposal operations in 1975. Waste disposal occurred in unlined permitted Cells 1 through 7 until 1992 when Cell 8 began operations. Cell 8 was the first permitted cell equipped with a COMAR approved bottom liner system and remains active at the present time.

Based on recent projections, Cell 8 will reach its disposal capacity in the next 3 to 4 years. Consequently, the County plans to construct Subcell 9.1 (initial subcell of Cell 9) beginning in 2014 to allow waste disposal operations to continue uninterrupted. Operating under Maryland Refuse Disposal Permit No. 2012-WMF-0240, issued by Maryland Department of the Environment, Cell 9 will be the final waste disposal area proposed for the facility.

The original design configuration for Cell 9 was presented in the Phase III Permit Application-Millersville Sanitary Landfill, Anne Arundel County, Maryland, Volumes I to III, submitted by GeoSyntec Consultants to the Department of the Environment, Bureau of Solid Waste in April 1994. Under Federal and State regulatory requirements, the final cell waste limits and design features considered local and regional site geology/hydrogeology, seasonal high groundwater levels, geotechnical factors, construction aspects, property limits, as well as all siting criteria covered under 40 CFR Part 258 (Subtitle D) which includes: airport safety, floodplains, wetlands, fault areas, seismic impact zones and unstable areas. That original design, including the waste disposal limits, bottom liner and leachate collection system, final cover system and final grades, and overall waste capacity, were approved by MDE in 1994.

ALTERNATIVES ANALYSES

As part of the Phase III Permit Application, wetlands impacts and alternatives were considered and discussed in Volume III, Appendix L, Wetlands Mitigation Project. Two previous studies are presented in that application as summarized below:

Alternatives Evaluation, Millersville Sanitary Landfill, Anne Arundel County, Maryland, prepared by Greenhorne & O'Mara, GBB and GeoSyntec, August 1994.

This report describes six (6) alternatives considered in the overall development of Cells 8 and 9 including one No Build Alternative (No. 1) and five Build Alternatives (Nos. 2 to 6), as listed below on Table 1

Table 1. Alternatives Analysis from August 1994 Report

Alternatives Considered	Description
1	No-Build. Cells 8 and 9 prohibited and no additional cells
2A, 2B	Avoid wetland impacts by locating Cell 8 to the northwest and Cell 9 to the southeast of the main channel to the Severn Run tributary. Same size and shape of cells as in Alternative 4
3	Total wetland avoidance by reducing size of Cells 8 and 9 relative to Alternative 4, as well as modifying their configuration
4D	Location Cells 8 and 9 per ACOE wetland permit application dated February 1991, which are the same as shown in the original footprint for Cells 8, 9 and 10 already under the Refuse Disposal Permit Number 86-02-04-06A.
5	Cell 9 configuration and size is modified relative to Alternative 4 to minimize wetlands impacts, but Cell 8 maintains the size and shape as per Alternative 4.
6	Configuration and size of Cells 8 and 9 are maintained to match Alternative 4, but reinforced soil walls are installed along portions of the perimeter berms.

Alternative 6 was the recommended as it "meets both objectives of minimizing wetland impacts and retaining maximum public benefits."

Wetlands Alternatives for Construction of Cells 8 and 9, Millersville Sanitary Landfill, Supplemental Joint Federal/State Application for Alteration of Any Floodplain, Waterway, Tidal or Non-Tidal Wetland in Maryland, by GeoSyntec Consultants and Hogan Environmental Consultants, April 1991.

This report indicates that avoidance, minimization and compensatory mitigation alternatives were considered, and ultimately 1.8 acres of wetlands will be impacted. Ten (1) alternatives, designated as Alternative A to J were considered as listed on Table 2 below:

Table 2. Alternatives Analysis from April 1994 Report

Alternatives Considered	Description
A	Conversion of Pond 8-1 to infiltration basin
B	Construction of infiltration trenches near Cell 9
C	Environmentally sensitive stream crossing structures between Cells 8 and 9
D	Use of BMPs in Pond 9-2 to attenuate potential temperature impacts to Wells Branch and to maximize potential infiltration through the pond bottom
E	Establishment of a conservation easement in Wells Branch
F	Establishment of a conservation easement in the Jabez Branch watershed
G	Reforestation of the MLF site
H	Removal of MSW from Cell 3 and construction of an infiltration basin in the location of Cell 3
I	Either the creation of forested and scrub-shrub wetlands or stream restoration in Jabez Branch
J	Utilization of a portion of the former Denton property for conservation easement

The final report recommended that all ten alternatives be implemented and "that the mitigation project has a high likelihood of success for replacing the function benefits lost in the filling of 1.8 acre of wetland in the Cell 9 area."

CELL 9 CONFIGURATION

The Cell 9 waste footprint (limits of waste only) covers a total area of 84 acres. It is planned to construct and fill Cell 9 in separate 14 to 15 acre subcells moving from east (Subcell 9.1) to west (Subcell 9.5). The waste disposal footprint, side slopes, final elevation, bottom and final cover systems that were permitted in 1994 have been retained in the current design. Relatively minor design revisions were necessary to update the design to current industry standards, but these changes were consistent with permit and regulatory requirements and have been discussed with MDE.

The Cell 9 limits and overall configuration have not been significantly altered since the 1994 permit issuance; the only changes have been to update the design to current standards and incorporate the additional detail required for a construction level design. However, two relatively small changes to the amount of wetland disturbance have taken place.

First, a more recent wetlands delineation in 2012 identified 0.13 acres of PFO wetlands not previously identified in the 1991 delineation. The 2012 wetland delineation submittal was provided to the Corps of Engineers and confirmed on April 23, 2013 by Richard Kirby (#1013-00773-M18).

Second, the original design for Cell 9 included a total of 1.8 acres of wetland disturbance. This area of disturbance factored in a mechanically stabilized earthen (MSE) wall proposed under Alternative 6. However, due to design and construction considerations for Subcell 9.1, the MSE wall was replaced with a simple earthen slope. This change increased the area of wetland impact for Subcell 9.1 by 0.11 acres for a total of 0.23 acres.

SUMMARY

In summary, from 1991 to the present time, the County has commissioned several wetland impact and landfill design studies regarding the configuration, construction and operations for Cell 9. Minimizing wetland impacts and at the same time providing an environmentally protective waste disposal facility to manage the County waste were of the highest priority.

Previously permitted impacts were mitigated through a variety of approved methods. The additional proposed impacts as part of this Cell 9 permit application are being mitigated for

onsite as part of the Wells Branch Stream Restoration and Wetland Creation project that is currently under review by MDE.

EXECUTIVE SUMMARY

Anne Arundel County (AAC) is in the process of obtaining a Phase III permit to operate the Millersville Sanitary Landfill. As part of the permitting process, it was determined that approximately 1.8 acres of wetlands will be impacted by construction of Cell 9. Impacts to wetlands as a result of construction of Cell 8 have been completely avoided. This report has been prepared to evaluate the minimization and mitigation alternatives for the impact to wetlands during construction of Cell 9.

Section 404 of the Clean Water Act requires that all adverse impacts be evaluated before dredged or fill materials can be discharged into waters of the United States (U.S.), including wetlands. Direct disposal of such materials may destroy or significantly alter natural habitats and decrease the diversity of plant and animal species found in those waters. The decision whether to issue a U.S. Army Corps of Engineers (Corps) permit for placement of fill material in wetlands is based on an evaluation of the probable impacts, including cumulative impacts, of the proposed activity and its intended use in the public interest. In addition, the sequencing of mitigation strategies described below is to be followed.

- **Avoidance.** A Corps permit is to be issued only for the least environmental damaging practicable alternative. No discharge is to be permitted if there is a practicable alternative to the proposed discharge which would have less impact to the aquatic ecosystem, so long as the alternative does not have other significant environmental consequences. Compensatory mitigation may not be used as a method to reduce environmental impacts related to the evaluation of the least damaging alternative.

- **Minimization.** Appropriate and practicable steps to minimize the adverse impacts are required through project modifications and permit conditions.

- **Compensatory Mitigation.** Appropriate and practicable compensatory mitigation is required for unavoidable adverse impacts which remain after all appropriate and practicable minimization has been required. In determining compensatory mitigation, the functional values lost by the resource to be impacted must be considered. Generally, in-kind mitigation is preferable to out-of-kind mitigation. The likelihood of success of the mitigation project must also be considered.

AAC has fully complied with the mitigation sequencing process described above. This report describes the avoidance, minimization, and compensatory mitigation program followed by AAC during the permitting process. The program consists of ten alternatives each comprising one of the following three categories: (i) minimization alternatives; (ii) alternatives for mitigation of direct impacts to wetlands; and (iii) alternatives for mitigation of indirect impacts to wetlands. The ten alternatives considered in this report are:

- *Alternative A:* Alternative A is the conversion of Pond 8-1 to an infiltration basin.

- *Alternative B:* Alternative B consists of the construction of infiltration trenches near Cell 9.

- *Alternative C:* Alternative C involves the use of an environmentally sensitive stream crossing structure between Cells 8 and 9.

- *Alternative D:* Alternative D is the use of best management practices (BMP) in Pond 9-2 to attenuate potential temperature impacts to Wells Branch and to maximize potential infiltration through the pond bottom.

- *Alternative E:* Alternative E consists of the establishment of a conservation easement in Wells Branch.

- *Alternative F:* Alternative F consists of the establishment of a conservation easement in the Jabez Branch watershed.

- *Alternative G:* Alternative G involves reforestation of the MLF site.

- *Alternative H:* Alternative H is the removal of MSW from Cell 3 and the construction of an infiltration basin in the location of Cell 3.

- *Alternative I:* Alternative I consists of either the creation of forested and scrub-shrub wetlands or stream restoration in Jabez Branch.

- *Alternative J:* Alternative J consists of the utilization of a portion of the former Denton property for a conservation easement.

It is anticipated based on existing surface and subsurface data that hydrologic and hydrogeologic conditions are favorable for all of the mitigation alternatives. Based on the hydrologic/hydrogeologic and environmental benefits, cost, and the schedule for implementation, all ten alternatives should be implemented. Upon implementation of these alternatives, the mitigation project has a high likelihood of success in replacing the functional benefits lost in the filling of wetlands in the Cell 9 area.

1. INTRODUCTION

1.1 Terms of Reference

This report was prepared for the Anne Arundel County (AAC) Department of Public Works by GeoSyntec Consultants (GeoSyntec) and Hogan Environmental Consultants (HEC). The report was prepared by Mr. Harold E. Gill, P.G., Dr. Makram Jaber, P.E., Ms. Molly Davis of GeoSyntec, in association with Mr. Theodore Hogan of HEC, and it was reviewed by Mr. Steven Shugart, P.G., of GeoSyntec and Mr. Richard Parks, P.E., of AAC.

1.2 Overview of the Permitting Process

Section 404 of the Clean Water Act requires that all adverse environmental impacts be evaluated before dredged or fill material can be discharged into waters of the United States (U.S.), including wetlands. Direct disposal of dredged or fill materials into waters of the U.S. may destroy or significantly alter natural habitats and decrease the diversity of plant and animal species found in those waters. The decision whether to issue a U.S. Army Corps of Engineers (Corps) permit for excavation, or filling, of waters of the U.S., is based on an evaluation of the probable impacts, including cumulative impacts, of the proposed activity and its intended use in the public interest. All factors which may be relevant to the proposal must be considered, including conservation, economics, aesthetics, general environmental concerns, wetlands, historic properties, fish and wildlife values, flood hazards, floodplain values, land use, navigation, shore erosion and accretion, recreation, water supply and conservation, water temperature impacts, energy needs, safety, food and fiber production, mineral needs, consideration of property ownership, and, in general, the needs and welfare of the people. A permit application must comply with the 404(b)(1) Guidelines (Guidelines) issued by the U.S. Environmental Protection Agency (USEPA).

On 7 February 1990, a Memorandum of Agreement (MOA) between the Corps and the USEPA became effective. The MOA clarifies the procedures to be used in determining the type and level of mitigation necessary to demonstrate compliance with the Guidelines. In determining appropriate and practicable measures to offset unavoidable impacts, such measures should be appropriate to the scope and degree of those impacts and practicable in terms of cost, existing technology, and logistics in light of overall project purposes. The Corps is to give full consideration to the views of the resource agencies when making this determination.

The sequencing of mitigation strategies described below is to be followed in carrying out the intent of the MOA.

- **Avoidance.** A Corps permit is to be issued only for the least environmental damaging practicable alternative. No discharge is to be permitted if there is a practicable alternative to the proposed discharge which would have less impact to the aquatic ecosystem, so long as the alternative does not have other significant environmental consequences. Compensatory mitigation may not be used as a method to reduce environmental impacts related to the evaluation of the least damaging alternative.

- **Minimization.** Appropriate and practicable steps to minimize the adverse impacts are required through project modifications and permit conditions.

- **Compensatory Mitigation.** Appropriate and practicable compensatory mitigation is required for unavoidable adverse impacts which remain after all appropriate and practicable minimization has been required. In determining compensatory mitigation, the functional values lost by the resource to be impacted must be considered. Generally, in-kind mitigation is preferable to out-of-kind mitigation. The likelihood of success of the mitigation project must also be considered.

This report demonstrates that AAC has fully complied with the mitigation sequencing process described above. The report describes the avoidance, minimization, and compensatory mitigation program followed by AAC during this permitting process.

1.3 Purpose of the Report

The purpose of this report is to present the results of an evaluation of the various alternatives for the avoidance, minimization, and mitigation of wetland alterations associated with the construction of Cell 8 and Cell 9 at the Millersville Sanitary Landfill (MLF). The report describes the wetlands that exist on the MLF property and the impacts to wetlands as a result of construction of Cells 8 and 9. The report presents a program developed for wetland avoidance, minimization, and compensatory mitigation at the MLF site, and the mitigation alternatives contained in the wetlands program. This report will be submitted to the following regulatory agencies:

- U.S. Army Corps of Engineers (Corps);
- U.S. Environmental Protection Agency (USEPA);
- U.S. Fish and Wildlife Service (USFWS);
- National Marine Fisheries Service (NMFS);
- Maryland Department of Natural Resources (DNR); and
- Maryland Department of the Environment (MDE).

Authorization to proceed with the alteration of the wetlands associated with the construction of Cell 9 is contingent upon acceptance of AAC's mitigation proposal by the above agencies. Wetland impacts

resulting from construction of Cell 8 have been totally avoided and will be discussed herein.

As stated previously, a Corps permit is required for the placement of dredged or fill material in waters of the United States. Waters of the United States include wetlands and water bodies such as streams, rivers, and lakes, including intermittent streams. Normally, a Maryland Nontidal Wetlands Permit (i.e., State permit) is also required for impacts to nontidal wetlands. In the case of this project, however, the application for a Corps permit predates the requirement for obtaining a State permit, and therefore the impacts resulting from Cell 9 are grandfathered from the Nontidal Wetlands Protection Act.

As part of the Federal permit process, a Coastal Zone Consistency Determination from the Maryland DNR and a Water Quality Certification from the MDE are also required. AAC has worked closely with the Corps and Maryland DNR to develop the wetlands mitigation requirements for the MLF project. AAC has also addressed water temperature impacts issues as related to stormwater management for Cells 8 and 9.

In addition to the Maryland DNR and MDE, the USEPA, USFWS, and NMFS will all submit comments to the Corps through the permit process. The Corps has advised AAC that the wetland impacts for Cell 9 qualify for processing under Nationwide Permit 26 (Corps permit). The Federal and State reviewing agencies will submit comments to the Corps after the Corps issues a Predischarge Notification. The coordination conducted with Maryland DNR and the Corps to date, culminating in this report, is intended to facilitate issuance of the Corps permit. This report demonstrates that wetland impacts have been avoided to the extent practicable, that wetland impacts will be minimized by design modifications, and that compensatory mitigation will be adequately provided for unavoidable impacts to wetlands.

In addition to the agencies listed above, the mitigation proposal will also be presented to the MLF Citizens Advisory Committee. Each of

the preceding organizations has been involved, in varying degrees, in the Joint Federal/State Permit Application process.

1.4 Contents of Report

The report is organized as indicated below.

- Background Information (Section 2).
- Avoidable and Unavoidable Wetland Impacts at the MLF Site (Section 3).
- Formulation of Minimization and Mitigation Alternatives (Section 4).
- Alternatives for Minimization of Impacts to Wetlands (Section 5);
- Alternatives for Mitigation of Direct Impacts to Wetlands (Section 6);
- Alternatives for Mitigation of Indirect Impacts to Wetlands (Section 7);
- Summary and Recommendations (Section 8).
- References (Section 9).

2. BACKGROUND INFORMATION

2.1 Site Location, Description, and Development Plan

The MLF site is located about 1 mile due east of Fort George G. Meade and approximately 1 mile northwest of Millersville in northern Anne Arundel County, Maryland (see Figure 1). The site is located in the Odenton Quadrangle of the United States Geological Survey (USGS) 7.5 minute map at a latitude of approximately N39°5'30" and a longitude of approximately E76°40'00". The site occupies approximately 567 acres.

The MLF site (see Figure 2) is divided into two sections by a 120-ft wide Baltimore Gas and Electric (BG&E) right-of-way that is oriented generally west to east across the northern third of the site. The cells north of the right-of-way have been filled and are scheduled to be capped in accordance with Annotated Code of Maryland, Title 26, Department of the Environment, Subtitle 04, Regulation of Water Supply, Sewage Disposal, and Solid Waste, Chapter 07 Solid Waste Management, Section 21 Sanitary Landfills - Closure (COMAR 26.04.07.21), and as required by the Complaint and Order issued by MDE in April 1992. The specifics regarding the proposed closure of Cells 1 through 4 are described in the closure and remedial action plan (CAPRAP) [GeoSyntec, 1992a].

The middle portion of the site contains Cells 5, 6, 7, and 8. Cells 5, 6, and 7 have been combined into a single cell (i.e., Cell 567), filled, and will be capped by 1997 in accordance with the Cell 567 closure plan [GeoSyntec, 1993].

Cell 8 is currently being used for landfilling activities. It is projected that Cell 8 will be filled by 1999. Cell 8 is being constructed and operated, and will be closed in accordance with Title 40 Code of Federal Regulations (40 CFR) Part 258 (i.e., Subtitle D) [GeoSyntec, 1992b].

The southern third of the site, south of Wells Branch, is undeveloped and either densely wooded or covered with heavy brush. Cell 9 will be constructed in this area of the site. Soil stockpiling activities (see Figure 3) in Cell 9 are anticipated to begin in 1995. Actual landfilling operations are not expected to begin in Cell 9 until 1999.

Elevations at the site range from a low of about 80 ft above mean sea level (MSL) datum at the eastern site boundary along the intermittent stream banks, to a high of just over 240 ft above MSL datum at the southern and western site boundaries.

2.2 Hydrology and Hydrogeology Setting

2.2.1 Site Hydrology

An intermittent stream, Wells Branch, flows across the site, generally from west to east, becoming perennial at the eastern site boundary (see Figure 2). At the MLF site, surface-water flow into Wells Branch is from storm-water runoff from undeveloped areas, wetland seeps (i.e., areas where ground water discharges at the ground surface), and outfalls from sediment basins, ponds, and traps. From the property boundary, Wells Branch continues to flow to the east until merging with the Severn Run, which, in turn, flows into the Severn River. Severn Run is a Maryland Class IV waterway (Recreational Trout Waters) and is the primary source of fresh water to Severn River, a tidal tributary of the Chesapeake Bay. Severn Run is stocked annually with trout for recreational fishing and supports anadromous spawning activities [Massicot, September 1992]. The Severn River is designated as a state scenic river.

Wells Branch is a small headwater stream to the Severn Run. Aquatic biota in headwater streams are important to the overall stream ecosystem. The biota serve as processors of the organic matter in the watershed (e.g., leaves, twigs, and other organic matter present in wetlands) which

provides the basis of the energy and food supply for the higher order downgradient streams (i.e., production export).

2.2.2 Site Hydrogeology

The site geology and hydrogeology are discussed in detail in several reports prepared by GeoSyntec [GeoSyntec, 1990, 1992a] and are summarized herein. The MLF site is underlain by unconsolidated sediments, consisting of stratified layers of sand, gravel, silt, and clay overlying consolidated crystalline basement rocks. Four water-bearing zones, Zone 1 through Zone 4, have been identified in the upper 300 ft of the unconsolidated sediments at the site. Potentiometric surface maps developed for the four zones were presented in a report by GeoSyntec [1992c]. Ground-water monitoring wells or piezometers have been installed within each water-bearing zone in the subsurface beneath the MLF. The water-bearing zones in the vicinity of Cells 8 and 9 are illustrated on Figures 4 and 5 and are generally described as follows:

- In the uppermost zone (i.e., Zone 1) ground water is unconfined in primarily fluvial sands and perched on the upper confining layer. The areal extent of Zone 1 is restricted to the southern and southwestern boundaries of the site, north of Dicus Mill Road, and along Burns Crossing Road, respectively.

- The second water bearing zone (i.e., Zone 2) occurs in a series of disconnected shallow sand zones within the upper confining layer at the site. In the southern part of the site, Zone 2 may be either unconfined or confined, and is recharged directly from the overlying perched aquifer (i.e., Zone 1).

- The third water-bearing zone (i.e., Zone 3) is a deep sand zone within the upper confining layer that may be either semi-confined or confined across the site. Zone 3 is used as a residential water supply by some of the homes within 0.5-mile

of the site. This zone may be recharged by leakage from the overlying zones (i.e., Zones 1 and 2).

- The fourth water-bearing zone, the Patapsco aquifer, (i.e., Zone 4) is the major ground-water aquifer in the vicinity of the MLF. This aquifer is confined at MLF by a basal clay unit in the upper confining layer.

2.3 Existing Wetlands

The construction of Cell 9 will result in the filling of 1.8 acres of palustrine forested wetlands. The wetlands at the MLF site were delineated by Greenhorne & O'Mara, Inc. (Greenhorne & O'Mara) in December 1990 and are shown on Figure 2. The report describing the existing wetlands is included in Appendix A to this report.

The wetlands in the vicinity of Cells 8 and 9 are in the floodplain and ground-water seep areas of Wells Branch. Dominant overstory species include Red Maple (*Acer rubrum*), Sweetgum (*Liquidambar styraciflua*), and Black Willow (*Salix nigra*). Dominant shrub species include Spicebush (*Lindera benzoin*), Sweet Pepperbush (*Clethra alnifolia*), Black Gum (*Nyssa sylvatica*), Highbush Blueberry (*Vaccinium corymbosum*), and Sweetbay Magnolia (*Magnolia virginiana*). Dominant woody vines and herbaceous species include Sensitive Fern (*Onoclea sensibilis*), Japanese Honeysuckle (*Lonicera japonica*), False Nettle (*Boehmeria cylindrica*), Greenbrier (*Smilax rotundifolia*),and blackberry (*Rubus allegheniensis*). A complete list of the wetland species found at the site is included in Appendix A. According to the Cowardin Classification System these wetlands are classified as palustrine forested with broad-leaved, deciduous vegetation and a temporary water regime (PFOIA). In the western portion of the site the wetlands are confined to a channel and are classified as riverine perennial streambed with a mud bottom (R4SB3).

A Wetland Evaluation Technique (WET) function and value assessment was performed on the existing wetlands in the vicinity of Cells 8 and 9. The results of this assessment are presented in Appendix A. A summary of function benefits of the existing wetlands is presented in Table 1. The physical and biological nature of the wetlands and the wetland location in the landscape are important factors used in the WET program for assigning assessment ratings. Although low probability ratings were assigned for effectiveness of the wetlands in providing most functions, WET did assign high probability ratings for floodflow alteration and sediment stabilization. The ratings imply that there exists a high probability that the wetlands near Cells 8 and 9 perform these functions and this value would be loss in the development of Cell 9. High ratings for floodflow alteration and sediment stabilization are representative of floodplain wetlands, because the wetlands provide storage of flood waters (floodflow) and bind sediment (sediment stabilization) that enters the floodplain during storm events. The sediment stabilization function reduces the sediment load carried in the stormwater runoff. The rating of these functions are important for evaluating the likely success of wetland minimization and mitigation alternatives.

2.4 Chronology of Site Development Activity to Date

AAC began landfilling operations at MLF in January 1975. The initial site development plan was prepared by Century Engineering [1974] and included ten distinct landfill cells numbered sequentially from Cell 1 to Cell 10. This plan located Cells 1 through 4 in the northern third of the site (i.e., north of the BG&E right-of-way), Cells 5 through 8 in the middle of the site, and Cells 9 and 10 in the southern third of the site.

During the period from January 1975 to the present, landfilling operations have been accomplished as follows:

- Cell 1 began receiving municipal solid waste (MSW) in January 1975 and the cell was completed in 1977;

- Cell 2 began receiving MSW in 1977 and the cell was completed in 1979;

- Cell 3 began receiving MSW in 1979 and the cell was completed in 1979;

- Cell 4 began receiving MSW in 1979 and the cell was completed in 1981;

- Cells 5, 6, and 7 began receiving MSW in 1981 and filling of the individual cells was completed in mid-1989;

- the areas between Cells 5, 6, and 7 began receiving MSW in 1989 and the combined cell (i.e., Cell 567) was completed in 1992; and

- Cell 8 began receiving MSW in October 1992 and the entire cell is estimated to have a projected life expectancy of about seven years. (NOTE: The life expectancy of Cell 8 is based on an estimated filling rate. This rate may change and Cell 8 could be filled either more quickly or more slowly.)

During the period from 1989 through 1992, GeoSyntec prepared waste disposal permit applications and construction documents for the MLF site [GeoSyntec, 1989a, 1989b, 1990a, 1990b, 1991, and 1992b]. The waste disposal permit applications included Phase II and Phase III reports. A Phase II consists of a geologic and hydrogeologic report, and a conceptual design of the proposed landfill, including the conceptual liner system design. A Phase III consists of a design report and design drawings that present the proposed design for the landfill facility.

The waste disposal permit application documents [GeoSyntec, 1989a and 1991] present a modified site development plan and a modified landfill design that incorporates changes to the original site development plan prepared by Century Engineering [1974] as indicated below.

- The original Century Engineering Cells 9 and 10 are combined into a single cell designated as Cell 9.
- A double-liner system and a geomembrane cover system are incorporated into the design of Cells 8 and 9.
- Cells 5, 6, and 7 are combined into a single cell.
- A geomembrane cover system is incorporated in the closure plan for combined Cells 567.

The Phase II and Phase III waste disposal permit applications have been reviewed and accepted by MDE. However, before the permitting process can continue (i.e., through the public hearing and issuance of a refuse disposal permit), MDE's Waste Management Administration is awaiting confirmation that a Corps permit will be issued for the construction of Cell 9.

In April 1992, AAC was ordered by MDE to start construction of a portion of Cell 8 with the double-liner system. At the present time, AAC is disposing MSW in Subcell 8.1, 8.2, and 8.4 of Cell 8. Subcell 8.3 has been completed and is ready to receive waste upon approval from the MDE. A master schedule illustrating AAC's planned activities for the MLF site is included in Appendix B.

2.5 Cell 9 Construction

As currently planned, Cell 9 is scheduled to begin receiving MSW in 1999. Filling of the subcells is planned from east to west (i.e., Subcell 9.1 to 9.11). During construction of some of the subcells in Cell 9, approximately 1.8 acres of wetlands will be filled. Because of this filling, ten minimization and mitigation alternatives were developed and are described in the report.

The liner for Subcell 9.1 will need to be under construction in 1998 for Subcell 9.1 to be ready for disposal of MSW in 1999. Cell 9 is estimated to have a projected life expectancy of 15 years and will be capped at the end of its useful life.

Prior to the actual landfilling operations in Cell 9, AAC intends to remove soil and construct a soil stockpile area in Subcells 9.4 through 9.6 (see Figure 3). The materials stockpiled therein (i.e., clay, clayey sand, silty sand, and top soil) will be utilized in the liner construction of Subcells 8.5 through 8.8, as daily cover in Subcells 8.1 through 8.8, and as final cover for Cells 1 through 8. Final access to Cell 9 from Cell 8 will be a road over a stream crossing (see Figure 3). The stream crossing will be designed to minimize impacts to wildlife and aquatic species in Wells Branch.

The soil types and quantities available in the Cell 9 area are an important asset. In particular, the clay material which will be used in the construction of the liner for Subcells 8.5 through 8.8 represents a readily available and inexpensive resource. For example, approximately 66,000 yd^3 of clay is needed for Subcells 8.5 through 8.8. The unit cost of trucking in this type material from off-site ranges between \$8.00/yd^3 to \$14.00/yd^3. Utilizing a unit cost of \$8.00/yd^3 and the Cell 8 quantity of 66,000 yd^3, it is estimated that a minimum cost of at least \$528,000 can be avoided. There are, of course, similar avoidable costs associated with the silty sand and top soil resources available from the Cell 9 area.

The clay for Subcells 8.5 through 8.8 will need to be stockpiled no later than the last quarter of 1995 in order to commence liner construction in Subcell 8.5 in mid-1995. Therefore, it will be necessary to disturb some wetlands before construction of the liner in Subcell 9.1 commences in 1998.

3. AVOIDABLE AND UNAVOIDABLE WETLAND IMPACTS AT THE MLF SITE

3.1 Overview

This section of the report discusses avoidable and unavoidable impacts to wetlands at the MLF site as a result of construction of Cells 8 and 9. Section 3.2 discusses avoidable impacts to wetlands and includes a discussion of the no-build alternative. Two types of unavoidable wetland impacts are described in this section of the report: (i) direct impacts (Section 3.3); and (ii) indirect impacts (Section 3.4). Direct impacts to wetlands include the excavation, or filling, of existing wetlands. Indirect impacts to wetlands are secondary impacts that occur as result of filling of wetlands (e.g., impacts on site hydrology, reduction in base flow support, etc.).

3.2 Avoidance of Wetlands Impacts

The original design for Cells 1 through 10 at the MLF site was performed by Century Engineering [1974] and was accomplished in a time period when nontidal wetland impacts were not thoroughly evaluated. After completing a wetlands delineation for the site in association with a proposed site re-design effort, it was learned that as originally designed, the proposed landfill footprint would impact approximately 8 acres of wetlands on the MLF site. Greenhorne & O'Mara and GeoSyntec performed an alternatives evaluation that reduced the impacts as much as practicable, based on design criteria available at that time [Appendix C, Greenhorne and O'Mara and GeoSyntec, August 1991].

On behalf of AAC, Greenhorne & O'Mara and GeoSyntec evaluated seven alternatives to avoid and minimize impacts to wetlands on the site, including a no-build alternative. The no-build alternative for Cells 8 and 9 was not considered feasible for the following reasons: (i) once the remaining active cells at the landfill are filled, there would be no

public facility available for disposal of the solid waste generated by the residents of AAC; and (ii) an undue economic and environmental burden on the residents and government of AAC would occur if the landfill closed and an alternate site was not available within the County.

After a thorough evaluation of the alternatives available, AAC requested that GeoSyntec re-design Cell 8 to totally avoid impacts to wetlands and re-design Cell 9 to minimize the area of wetlands impacted (see Alternative 6A in Appendix C). The re-design concept utilized reinforced soil walls in wetland areas for stabilizing the landfill toe as compared to an embankment with side slopes of 3 horizontal:1 vertical (3H:1V). The reinforced soil walls added over $1,000,000 to the construction cost of the project. The area of wetlands impacted by the re-design of Cells 8 and 9 was reduced from approximately 8 acres to 1.8 acres. It was impossible to avoid all impact to wetlands in designing Cell 9 and still maintain the economic value of the cell.

3.3 Unavoidable Direct Wetland Impacts

Construction of Cell 9 requires the filling of 1.8 acres of palustrine forested wetlands (see Figure 2). Most of the wetlands impact involves the filling of swales that flow into the headwaters of Wells Branch. Ground-water discharge into these swales, or wetland seeps, provides the hydrology to support these wetlands.

Generally, the Corps requires replacement of wetlands on a 2:1 basis. Therefore, as development of Cell 9 will result in the filling of 1.8 acres of wetlands, 3.6 acres of wetlands would normally be developed. In consideration of the functional volume of the lost wetlands, AAC has developed a comprehensive program for minimizing and mitigating wetland impacts. This program consists of ten alternatives. One of the alternatives presented in this report includes the option of either creating new wetlands (i.e., in-kind mitigation alternative) or a stream restoration alternative. AAC prefers the latter alternative as it

provides greater benefits to the overall ecosystem of Severn Run. This alternative is discussed in more detail in Section 7 of this report.

3.4 Unavoidable Indirect Wetland Impacts

Indirect wetland impacts are those impacts that relate to the hydrology of Wells Branch. The loss of wetlands results in a reduction of base flow support to Wells Branch, and other function benefits provided by wetlands including reduction in floodflow alternation, sediment stabilization, sediment/toxicant retention, and production export. To compensate for the lost benefits, infiltration basins and trenches are proposed in several locations at the site where ground water discharge is an important contributor to base flow in Wells Branch.

4. FORMULATION OF MINIMIZATION AND MITIGATION ALTERNATIVES

4.1 Overview

This section of the report discusses the formulation of minimization and mitigation alternatives for Cell 9. Ten alternatives are identified in this report and are separated into the following three categories: (i) minimization alternatives; (ii) alternatives for mitigation of direct impacts; and (iii) alternatives for mitigation of indirect impacts. The ten alternatives considered in this report provide enhancement, restoration, creation, and preservation of wetlands and are as follows:

- Alternative A - converting stormwater management Pond 8-1 to an infiltration basin;
- Alternative B - constructing infiltration trenches adjacent to Cell 9;
- Alternative C - using an environmentally sensitive stream crossing between Cell 8 and Cell 9;
- Alternative D - using best management practices (BMP) associated with Pond 9-2 to maximize infiltration and to minimize adverse impacts;
- Alternative E - dedication of a conservation easement in Wells Branch adjacent to the site;
- Alternative F - dedication of a conservation easement in Jabez Branch;
- Alternative G - reforestation of the MLF site to the maximum extent practicable;

- Alternative H - removal of Cell 3 and construction of an infiltration basin in its location;

- Alternative I - either creation of wetlands on the Devonshire Site (in-kind mitigation alternative) or restoration of a portion of Jabez Branch; and

- Alternative J - dedication of the former Denton property as a conservation easement.

Figure 6 shows the location of some of these alternatives. Table 2 identifies the wetland function benefits that can be replaced with each alternative. Although the primary functions of the lost wetlands in the Cell 9 area are floodflow alteration and base flow support to Wells Branch, the wetlands have other functions including: sediment stabilization (binding soils); sediment/toxicant retention (trapping soil and other pollutants); production export; wildlife habitat; and fisheries habitat. The objective of the ten alternatives presented above is to replace one or more of these functions. The costs associated with each alternative is presented in Table 3. The total cost of implementing all ten alternatives in 1993 dollars is in excess of $1.5 million.

4.2 Minimization of Wetland Impacts

Minimization alternatives are associated with minimizing potential impacts to wetlands through project modification and permit conditions. In addition to the efforts made by AAC to minimize impacts to wetlands on site by re-designing Cells 8 and 9 to incorporate reinforced soils, Alternatives A through D have been developed that further minimize potential impacts to wetlands. These alternatives minimize wetlands impacts by replacing the enhancement and preservation benefits of the lost wetlands. Alternatives A through D are described in detail in Section 5 of this report.

4.3 Mitigation of Wetland Impacts

4.3.1 Overview

Mitigation alternatives are compensatory alternatives for unavoidable adverse impacts to wetlands which remain after all appropriate and practical minimization efforts have been exhausted. In determining compensatory mitigation, the functional values lost by the wetlands must be considered. As discussed in Section 2.3, floodflow alternation and sediment stabilization are the primary functional values lost due to the filling of wetlands in the Cell 9 area. Generally, in-kind mitigation is preferable to out-of-kind mitigation.

4.3.2 Search for In-Kind Mitigation Alternatives

The search for in-kind mitigation sites within the Severn Run watershed was conducted on two occasions. The first search was conducted as part of the wetland alternatives report prepared by Greenhorne & O'Mara and GeoSyntec [August, 1991]. The primary basis of this search was a wetlands mitigation site search conducted by the Maryland State Highway Administration (SHA). The second search was conducted in 1994 by HEC on behalf of AAC and involved a review of aerial photography for the Severn Run watershed and site visits. The locations of the potential in-kind mitigation sites concluded from the two searches are shown on Figure 7. A summary of the two search follows; more detailed information on the site searches is provided in Appendix D.

SHA Search

The SHA conducted a search for wetland mitigation sites within the Severn River watershed and the South River watershed. In an undated report entitled "*Mitigation Areas Search for the South River and Severn*

River Watershed", SHA lists 166 sites that were initially considered potentially feasible as mitigation sites within the Severn River watershed. SHA's search reduced the 166 sites initially considered to five sites which were considered acceptable in varying degrees. The five sites are shown on Figure 7 and are described below.

- Site No. 1 is a small farm pond and adjacent agricultural field. The site is located on a ridge adjacent to the Severn Run floodplain. Any wetland creation attempted at Site No. 1 would not be directly connected to existing wetlands or streams. It does not appear that adequate hydrology could be provided at this site.

- Site No. 2 is located off Old Oak Road, and is the Chesapeake Baptist Church wetland mitigation project recently completed by SHA. It does not appear that any additional area for mitigation exists at this site.

- Site No. 3 is located in the vicinity of Site No. 2 on both sides of Teppers Road. This potential mitigation site is located in and adjacent to a swale that courses through agricultural fields. Wetland creation at the site would involve removal of soil adjacent to, and approximately to, the same elevation as the swale. Hydrology would be provided primarily by agricultural runoff and to an undetermined extent, by ground water. Hydrophytic vegetation in the swale downstream from Teppers Road suggests seasonal saturation which may be a function of high ground-water conditions. It appears that at least three acres, but no more than 3.5 acres of mitigation could be constructed downstream of the road, and that approximately 1.2 acres could be constructed upstream of the road (this assumes a 350-ft long by 150-ft wide wetland buffer would be constructed).

The extent of excavation required to provide adequate hydrology would vary, but should not exceed five feet. An average of 3.5 ft is likely. This project would provide a buffer to direct agricultural runoff, thereby improving water temperature impacts in Severn Run. Additional study of the site, including test borings and monitoring wells, would be required to determine the water budget available. The owner of the property that includes the potential mitigation area is unwilling to sell the property or easement required to implement this alternative.

- Site No. 4 is located in the community of Devonshire near the Millersville Elementary School. It is a relatively flat area previously excavated for construction of a dry stormwater management facility. The site is owned and maintained by AAC. The site is vegetated primarily with herbaceous species, but areas of the site contain sparse stands of virginia pine, red maple, and sweet gum. Two narrow swales were constructed to convey runoff from the cul-de-sac at the end of Isabella Court and from a riprap outfall located approximately 160 ft upstream from the cul-de-sac. These swales contain herbaceous and woody wetland species including common cattail, soft rush, willow (as shrubs), sweet gum (as shrubs), foxtail, and tickseed sunflower.

  Wetland mitigation has been performed on a portion of the site. Plans approved on 1 May 1992, including an "As-Built" date of 22 July 1993, depict a wetlands construction project within the existing split rail fence. Three areas designated as upland plantings are also shown outside the fence. Seasonal flooding occurs within the fenced area. The concrete weir shown on the plans has been installed. The purpose of the weir is to pond runoff to provide wetland hydrology within the mitigation area. This site appears suitable for wetland creation.

- Site No. 5 is an agricultural field separated from Site No. 4 by a hedgerow. Site No. 5 is approximately five ft higher in elevation than Site No. 4 and would require an excessive amount of excavation to produce wetland hydrology.

AAC Search

Not knowing the exact source of information used by SHA in its search for mitigation sites, or SHA's requirements for selecting potential mitigation sites, AAC conducted an independent search in 1994 to determine whether any additional sites within the Severn Run watershed might be suitable for wetland creation. The AAC search consisted of reviewing color infrared, and black and white, aerial photography available at AAC's Planning and Code Enforcement (PACE) office in Annapolis, Maryland. Sites that were non-wooded, met the basic size requirement, and were adjacent to existing streams were considered potential mitigation sites. Five sites met the prescribed requirements and are shown on Figure 6 as Site Nos. 6 through 10. The following is an evaluation of the five sites.

- Site No. 6 is an agricultural field located at the intersection of Maryland Route 175 and Gambrills Road. The area is about 13 acres in size, was cultivated in corn during the last growing season, and appeared wet on the aerial photography. The area is not considered a suitable mitigation area because no surface hydrology could be provided to the site (i.e., no streams exist in the area), the mitigation area would be isolated, with no contiguity with existing streams or wetlands, and adequate ground water is doubtful. The Anne Arundel County Soil Survey classifies this area as Sassafras loam. Sassafras soils are deep well-drained soils on uplands. Therefore, it is unlikely that ground water would be encountered within a reasonable depth to support a created wetland.

- Site No. 7 is an area south of Upton Road near Upton Park. This site lies adjacent to a tributary to Severn Run. This 10-acre area is an agricultural field. There does not appear to be adequate surface- or ground-water hydrology to support created wetlands in this area.

  A ball field in Upton Park was also visited; however, the area would require at least a 10-ft cut to match the elevation of the adjacent stream and wetlands, which would not be desirable, notwithstanding the loss of recreational value of the site. The 3.6 acres of mitigation required could not be provided at this site even if technically feasible.

- Site No. 8 is a ball field opposite Upton Park adjacent to Martin Spaulding High School. The site is adjacent to a stream and wetland complex. Although the area has some potential for wetland creation, it was considered unsuitable because the soils are well-drained even at the depth of the adjacent wetlands. Also, the created wetlands could have an adverse hydrological impact on the existing wetlands by diverting surface water from the existing bottomland hardwood forest to the mitigation area.

- Site No. 9 is Lake Marion, an artificial impoundment located in the Province subdivision near the intersection of Maryland Route 713 and Severn Road. It appears that projects could be undertaken to improve water temperature impacts in this Severn Run headwater area; however, there is not sufficient area for a wetlands creation project. Potential water temperature impacts improvement projects might include removal of a concrete outfall channel and replacing the channel with a shrub-lined swale, and installing fringe wetlands around the perimeter of the lake.

- Site No. 10 is the "Joy Pit", a sand and gravel operation located between Gambrills Road and the Severn Run Environmental

Area. Small wash ponds that exist on the property could potentially be converted to wetlands; however, there does not appear to be adequate area suitable for the wetland mitigation required for the MLF site. In addition, the wetlands would be isolated and not contiguous with adjacent streams or wetlands.

Based on these two searches, there does not appear to be any remaining sites within the Severn Run watershed suitable for in-kind wetland mitigation.

4.3.3 Formulation of Mitigation Alternatives For Direct Impacts

Alternatives E and F have been developed to mitigate direct impacts as a result of the unavoidable filling of 1.8 acres of wetlands. For these alternatives, conservation easements are established in Wells Branch (Alternative E) and Jabez Branch (Alternative F). Conservation easements are important to protect the land adjacent to the streams from development, and thereby, help maintain the integrity of the overall ecosystems of the streams. Alternatives E and F are considered restoration and preservation type mitigation alternatives and are discussed in more detail in Section 6 of this report.

4.3.4 Formulation of Mitigation Alternatives of Indirect Impacts

Alternatives G through J have been developed to provide mitigation of indirect impacts as a result of filling of wetlands in the Cell 9 area. These alternatives provide for wetland enhancement, restoration, creation, and preservation, and are discussed in more detail in Section 7 of this report.

5. ALTERNATIVES FOR MINIMIZATION OF IMPACTS TO WETLANDS

5.1 Introduction

This section of the report discusses four alternatives that have been developed to minimize the potential impacts associated with the filling of wetlands in the Cell 9 area. The four minimization alternatives discussed are:

- Alternative A - converting stormwater management Pond 8-1 to an infiltration basin;
- Alternative B - constructing infiltration trenches adjacent to Cell 9;
- Alternative C - use of an environmentally sensitive stream crossing between Cells 8 and 9; and
- Alternative D - use of best management practices (BMP) associated with Pond 9-2 to maximize infiltration and to minimize adverse impacts.

The purpose, feasibility, beneficial and adverse impacts, costs, and schedule and implementation of each of these alternatives are discussed in this section of the report.

In February 1984, MDE's Sediment and Stormwater Administration published the Maryland Standards and Specifications for Stormwater Management (SWM) and Infiltration Practices [MDE, 1984]. In this document, MDE recommends that a sound and effective stormwater management plan should be diversified and have multiple purposes, and that the plan should address the full range of hydrologic consequences resulting from urban development instead of focusing on control of peak flow. The use of infiltration practices in conjunction with other stormwater management

practices achieve these goals. In addition, the need to apply infiltration practices in conjunction with various flow attenuation practices and detention practices is implied in the Maryland Stormwater Management Act (i.e., Natural Resources Article 8-11A).

The MDE Sediment and Stormwater Administration has developed a list of four practices to be utilized in the overall stormwater management plan at a site. The practices, in MDE's order of preference, are as follows:

- infiltration of runoff;
- flow attenuation by use of open vegetated swales and natural depressions;
- stormwater retention structures; and
- stormwater detention structures.

Often, a combination of one or more of the above practices are used at a site to achieve the intended goal. Infiltration practices are used to reduce volume increases in flow to the maximum extent possible by allowing the stormwater to percolate into the ground-water system. In addition, infiltration practices provide water-quality benefits by reducing the impact of thermal loading into sensitive ecosystems. Retention and detention structures delay the release of the peak discharge to the surface-water system, and typically do not provide water-quality benefits. The infiltration structures proposed in this report have been designed in accordance with the criteria of the MDE Sediment and Stormwater Administration.

5.2 Alternative A - Converting Pond 8-1 to an Infiltration Basin

5.2.1 Overview

Pond 8-1 is an existing stormwater retention pond designed in accordance with current Maryland regulations for erosion and sediment control and stormwater management (i.e., MD-378). Alternative A consists of converting Stormwater Management Pond 8-1 (Pond 8-1) to an infiltration basin. Figure 8 provides the sequence of construction for converting Pond 8-1 from a stormwater management pond to an infiltration basin. Technical information used in the evaluation of Alternative A is provided in Appendix E.

5.2.2 Purpose

Alternative A achieves two important purposes: (i) compliance with MDE's recommendations for the design of sound and effective stormwater management plans; and (ii) minimization of the potential impacts on wetlands associated with the development of Cell 9.

An infiltration basin functions by discharging stormwater through slow percolation into the ground rather than overland discharge through an outlet structure. This results in significant alteration of peak flows from storms, and an increase of base flow support for nearby streams. Infiltration basins also trap sediment thus reducing the sediment load discharged into the stream. Therefore, conversion of Pond 8-1 to an infiltration basin will increase base flow support to Wells Branch, thus minimizing one of the most important potential impacts on the site hydrology. In addition, the slow release of stormwater through infiltration will result in an amelioration of water temperature impacts on Wells Branch.

5.2.3 Feasibility

The feasibility of converting Pond 8-1 to an infiltration basin is discussed in more detail in Appendix E. In summary, it was found, based on the currently available subsurface information, that Pond 8-1 is underlain by sandy soils, which provide the proper media for infiltration of surface-water runoff into the ground-water system. Preliminary design calculations show that the volume of water that can be stored in proposed infiltration basin 8-1 is approximately 1,400,000 gallons. This volume of water only considers storage below the spillway riser crest elevation. Water above this elevation would flow through the spillway outfall and discharge to Wells Branch. Surface-water runoff from the final cover of Cell 8 resulting from the 2-year 24-hour storm is equivalent to a volume of water of approximately 1,400,000 gallons. Therefore, the proposed infiltration basin is adequately sized to allow all of the Cell 8 runoff from the 2-year storm event to recharge water-bearing Zones 2 and 3.

5.2.4 Beneficial and Adverse Impacts

Conversion of Pond 8-1 to an infiltration basin will have the following beneficial impacts:

- the ground-water system in the vicinity of Pond 8-1 will receive recharge from the basin;
- the recharged ground-water system in the vicinity of Pond 8-1 will provide base flow support for Wells Branch; and
- the basin will function as a sediment trapping structure reducing the sediment load discharged into Wells Branch.

Conversion of Pond 8-1 to an infiltration basin should not have any adverse impacts on the ground-water or surface-water system in the vicinity of the pond.

In the past, infiltration structures have had a high rate of premature failure due to the installation of the structures before areas contributing surface-water runoff were stabilized. The end result was the rapid clogging of permeable soil by the high sediment load. Premature failure of infiltration Basin 8-1 will be minimized because the conversion of the pond to an infiltration basin will not occur until Cell 8 is entirely stabilized.

Infiltration basins require more frequent maintenance (i.e., cleanout) than storm-water management ponds. The major reason for the more frequent cleanout requirements associated with infiltration basins is that considerable amounts of sediment, suspended organic matter, and debris accumulate in the small soil pores on the bottom of the basin and reduce infiltration. By comparison, the same materials that can clog the soil surface of an infiltration basin are typically either removed through settling within the detention pond's storage reservoir or are passed through the much larger outlet orifice and out of the pond entirely. Removal of surface clogging in an infiltration basin may require a major cleanout operation involving the removal of the upper layers of the filter media and the replacement of the filter fabric. At a minimum, the infiltration basin will be inspected following at least one major storm event per year. Technical information on the construction and maintenance activities associated with infiltration structures is provided in Appendix F. This information will be included in the MLF Operations and Maintenance guide.

5.2.5 Costs

The construction costs for the conversion of Pond 8-1 to an infiltration basin are estimated to be about $17,450 in 1993 dollars. The estimated engineering costs are about $6,000. Therefore, the total cost of this alternative is $23,450. The breakdown of the proposed construction and engineering costs is shown in Table 4.

5.2.6 Schedule and Implementation

Construction of Pond 8-1 was completed in October 1992. It is proposed to convert Pond 8-1 to an infiltration basin after the final cover system for Cell 8 is stabilized with permanent vegetation and the pond is no longer needed for sediment control. The conversion of Pond 8-1 to an infiltration basin would likely occur during the development of Subcells 9.1 and 9.2 of Cell 9.

During the conversion of Pond 8-1 to an infiltration basin, the low-flow sediment control devices will be removed and the low-flow de-watering orifices located below the riser crest will be plugged. The bottom of the pond will be cleared of low-permeability deposits and replaced with a 6- to 12-in. filter layer of coarse sand to help prevent the soil surface from becoming clogged. The filter layer will be replaced or cleaned when it becomes clogged.

It is anticipated that Cell 8 has an approximate waste disposal life of seven years, and that two additional years would be required for permanent soil stabilization. Therefore, Pond 8-1 could be converted to an infiltration basin after the capping and soil stabilization of Cell 8 (i.e., about 2001, see Appendix B).

5.3 Alternative B - Constructing Infiltration Trenches Adjacent to Cell 9

5.3.1 Overview

Alternative B is the construction of infiltration trenches north of Cell 9 adjacent to Subcells 9.8, 9.10, and 9.11 (see Figure 6). A preliminary evaluation of infiltration basins and trenches for the Cell 9 area indicated that only infiltration trenches in the area adjacent to the southwest tributary of Wells Branch were potentially feasible (see

Appendices D and F). In order to investigate the feasibility of using infiltration trenches in the Cell 9 area, a field investigation program was conducted. A conceptual design of a typical infiltration trench is shown in Figure 9. The technical information used in the evaluation of Alternative B is provided in Appendix E.

5.3.2 Purpose

Alternative B is conceptually similar to Alternative A (i.e., converting Pond 8-1 to an infiltration basin) and achieves the same purposes: (i) compliance with MDE's recommendations for the design of sound and effective stormwater management plans; and (ii) minimization of the potential impacts on wetlands associated with the development of Cell 9.

As shown in Table 2, the purposes of an infiltration trench are to alter the peak flow from a storm and to provide an increase of base flow support for nearby streams. In addition, the infiltration trench will act as a sediment trapping structure and reduce the sediment load discharged into Wells Branch.

5.3.3 Feasibility

Infiltration trenches for the Cell 9 area were evaluated using the following criteria:

- the maximum ponding and storage time as established by the MDE guidelines is for the 2-year, 24-hour storm event in which stored runoff within the structure should be completely drained within a 72-hour period;

- depth to high ground-water table should allow for a minimum 2-ft separation between the bottom of the trench and the seasonally high water table;

- topographic conditions; and

- existing land use (i.e., wetlands).

Based on the information available at the time that the preliminary evaluation was performed, it appeared that much of the area north of Cell 9 along the main channel of Wells Branch (i.e., downstream of Pond 8-1) is underlain by a thick layer of clayey soils (Figure 4). Therefore, the area north of Cell 9 does not provide the proper media for infiltration of surface water into the ground-water system through an infiltration trench. However, existing site soil boring data revealed three potentially suitable areas along the southwestern tributary of Wells Branch (i.e., between Cells 8 and 9). The three areas are shown on Figure 6 and labeled B-1, B-2, and B-3.

In order to investigate the three areas listed above, a soil boring program was completed at the site. Five soil borings were installed and soil samples were collected. The soil borings are provided in Appendix G. The purpose of the five soil borings was to confirm the presence of sand zones that could function as infiltration layers for the infiltration trenches.

Area B-1 is in the upland area of the southwest tributary of Wells Branch between elevations 160 and 190 ft. Soil boring F-19, at an elevation of 170 ft, encountered 8 ft of silty sand above a low-permeability clayey silt layer. An area of standing water near boring F-19 suggests that a perched water table was at the land surface at the time of drilling and that a 2-ft separation between the perched water table in Zone 1 and the base of an infiltration trench may be difficult to achieve in parts of Area B-1. The base of an infiltration trench in

Area B-1 must be at least 2 ft, but preferably 4 ft above the perched water table (i.e., elevation 174 ft and higher).

Area B-2 is near a soil boring F-20 that has a 9-ft layer of silty clay with sand and is underlain by 25 ft of silty sand and sandy silt. The water table was encountered at 35 ft, indicating a 25-ft thick unsaturated Zone 2 sand sequence. An infiltration trench in this area would need to be deep enough to penetrate the base of the surface silty clay layer (i.e., maximum 9 ft) and penetrate at least several ft into the underlying Zone 2 sand.

Area B-3 is the most downstream area between Cell 8 and 9. Based on soil boring F-26, Area B-3 is in the outcrop area of Zone 2 where a surface sand sequence should be encountered.

In summary, the results of the soil boring program reveal that Area B-2 has limited sand zones available for infiltration and B-3 does not have adequate sand zones in order to function as infiltration layers. Adequate sandy material was located in Area B-1 to support the installation of infiltration trenches.

In the preliminary evaluation of the potential feasibility of groundwater recharge using infiltration trenches, it was estimated that the trenches could recharge approximately 70,000 gallons per year. However, based on the soil borings installed in Areas B-1, B-2, and B-3, that quantity of recharge will not be feasible. It appears that the maximum quantity of recharge will be approximately 20,000 gallons per year, or 30 percent of the original estimated recharge.

5.3.4 Beneficial and Adverse Impacts

Construction of infiltration trenches in the vicinity of Pond 9-2 will have the following beneficial impacts:

- the ground-water system in the vicinity of Pond 9-2 will receive recharge from the pond;

- the recharged ground-water system in the vicinity of Pond 9-2 will provide some base flow support to Wells Branch; and

- the infiltration trenches will act as sediment trapping structures and reduce the sediment load discharged into Wells Branch.

Construction of infiltration trenches in the vicinity of Cell 9 should not have any adverse impacts on ground water or surface water. Technical information on the construction and maintenance activities associated with infiltration structures is provided in Appendix E. This information will be included in the Operations and Maintenance Plan for the MLF site.

5.3.5 Costs

The estimated cost to construct an infiltration trench in Area B-1 is approximately $9,470. The estimated engineering costs are approximately $8,000. Therefore, the total cost of this alternative is $17,470. The breakdown of construction costs in 1993 dollars is shown in Table 4.

5.3.6 Schedule and Implementation

Cell 9 will begin receiving MSW in Subcell 1 after the closure of Cell 8. The expected life of Cell 9 is approximately 15 years. Soil stabilization of the final cover will require about two years before infiltration trenches could become operational. Therefore, the installation of the trenches would begin after the capping and soil stabilization of Cell 9 (i.e., 2016, see Appendix B).

5.4 Alternative C - Environmentally Sensitive Stream Crossing Between Cell 8 and Cell 9

5.4.1 Overview

Alternative C involves the construction of an environmentally sensitive stream crossing structure between Cells 8 and 9. As shown in Figure 6, the stream crossing will be located on Wells Branch in the western portion of Cells 8 and 9 where an access road will be constructed. The access road is integral to the operation of the MLF for the reasons presented below.

- The road will provide access to transport large quantities of soil between Cells 8 and 9.

- The soil material that will be excavated from the Cell 9 ft print will be used: (i) for daily cover during the operation of Cell 8; (ii) for construction of Subcells 8-5 through 8-8; (iii) for construction of Cell 9; and (iv) for daily cover during operation of Cell 9.

- The access road between Cells 8 and 9 will provide separate access for vehicular traffic to transport excavated soil from the Cell 9 area to the Cell 8 area. Furthermore, the proposed access road will avoid unsafe traffic conditions that could occur at the site (i.e., trucks and heavy equipment hauling excavated soil and vehicles (commercial and private) bringing solid waste into the landfill using the same road).

It is not practical to avoid construction of an access road and stream crossing structure between Cells 8 and 9. The access road between Cells 8 and 9 is essential to the efficient operations of the landfill because it will significantly reduce traffic congestion on the main landfill access road. A permanent arched stream crossing is preferred

to a temporary crossing due to the potential for excessive damage to the wetlands that may result when the stream crossing is removed. In addition, a permanent stream crossing enables the leachate collection system for Cell 9 to be routed beneath the access road and connected to the leachate collection system for Cell 8, resulting in a cost savings for the County.

Figure 10 illustrates two designs for the stream crossing: (i) a standard culvert and 3H:1V embankment side slope; and (ii) an arched culvert and reinforced soil wall design. One advantage of the arched stream crossing is that the arched culvert does not have a bottom and will not result in any disturbance of Wells Branch or in turbulent flow in Wells Branch. As shown on Figure 10, the area of wetlands impacted for the standard culvert and arched culvert is about 0.3 acres and 0.08 acres, respectively. Therefore, a bottomless arch-type stream crossing is preferred to a standard culvert as the area of wetlands impacted is less for the arch crossing.

5.4.2 Purpose

The purpose of using the arched stream crossing is to minimize the potential impacts to the flow in Wells Branch and to allow free movement of large and small animals, and aquatic species, along the corridor of Wells Branch. The arched stream crossing will be of sufficient size to not impede the flow hydraulics in Wells Branch. As the proposed stream crossing is bottomless, the sediment stabilization functions of the existing wetlands will be preserved.

At some time in the future after Cell 8 is filled, the need for separate access roads will be re-evaluated. If justification exists, and if the stream crossing can be removed without environmental degradation of the Wells Branch wetlands, then the access road to Cell 9 may be moved to a different location. Relocating the access road will also require relocating the leachate collection system pipeline for Cell 9 as the line

is currently designed to tie into the leachate collection system pipeline for Cell 8 on the north side of the access road.

5.4.3 Feasibility

GeoSyntec evaluated the feasibility of constructing a sensitive stream crossing between Cells 8 and 9. In summary, GeoSyntec found that using an arched stream crossing rather than a standard culvert will minimize the overall wetland impacts. If the arched stream crossing is used based on these recommendations, no adverse consequences would occur to the flow in Wells Branch. Additionally, the arched stream crossing will allow free movement of large and small animals, and aquatic species, along the corridor of Wells Branch. If a standard culvert were utilized instead of the arched stream crossing, the wetlands and the stream flow in Wells Branch could potentially be impacted. The standard culvert would be placed in the stream bed of Wells Branch and backfill would be placed around the outside of the culvert, thereby, potentially restricting flow and hindering the movement of fish and wildlife.

The Maryland DNR has been consulted relative to the dimensions of the culvert necessary for the passage of wildlife (i.e., to minimize the "tube effect"). Maryland DNR recommended that the length of the structure be no greater than the value of the cross sectional area of the structure, and that the height of the structures be at least seven ft (i.e., personal communication Mr. C. Brunori, DNR). If an arched stream crossing is practical, AAC will ensure that the Maryland DNR design recommendations are followed.

5.4.4 Beneficial and Adverse Impacts

The arched stream crossing will have beneficial impacts in comparison to using a standard culvert for providing access across Wells Branch between Cells 8 and 9. The beneficial impacts will include the

following: (i) minimizing changes of the flow system in Wells Branch; (ii) freedom of movement through the archway by large and small animals and aquatic species; and (iii) no excessive filling of existing wetlands in the Wells Branch corridor. Furthermore, less wetlands will have to be filled using the reinforced soil wells with the arched stream crossing rather than using a standard culvert stream crossing. No adverse impacts are expected from using the arched stream crossing.

5.4.5 Costs

The estimated construction costs for an arched stream crossing will be approximately $100,000. The estimated engineering costs are approximately $8,000. Therefore, the total estimated cost of this alternative is $108,000.

5.4.6 Schedule and Implementation

Construction of the sensitive stream crossing and access road will begin in mid-1995. Soil stockpiling activities in Cell 9 are scheduled to begin during this period. Soil in the Cell 9 area will be used for daily cover during the operation of Cell 8 and for the construction of the Subcells 8.5 through 8.8 in Cell 8. Actual landfilling operations are not expected to begin in Cell 9 until 1999.

5.5 Alternative D - Best Management Practices For Pond 9-2

5.5.1 Overview

Alternative D incorporates best management practices (BMP) in Pond 9-2 to attenuate potential temperature impacts and to maximize potential infiltration through the pond bottom. The BMP will include the following: (i) use of shading around the pond and along the riprap

discharge channel from the pond to Wells Branch; (ii) operational controls to maximize infiltration through the bottom of the pond; and (iii) other techniques to attenuate potential temperature impacts and to maximize infiltration through the pond bottom.

5.5.2 Purpose

The purpose of using BMP at the Cell 9 pond is to minimize potentially adverse impacts on Wells Branch. The potentially adverse impacts could include the following: (i) changing the temperature regime within Wells Branch; and (ii) reducing the amount of infiltration recharging the ground water in the vicinity of Pond 9-2. As shown in Table 2, the wetland function benefits that are achieved with this mitigation alternative include floodflow alternative and baseflow support to Wells Branch. A detention pond, if properly maintained, will delay the peak discharge from the design storm and slowly release the stormwater into the receiving stream.

5.5.3 Feasibility

The use of BMP at the Cell 9 pond to minimize adverse impacts is feasible. Trees can be planted along the riprap lined discharge channel to provide additional shading in that area. The additional shading will reduce the overall temperature in that area and marginally reduce the temperature of the water discharging through the channel. Furthermore, landfill personnel can implement an operational program for Pond 9-2 that includes frequent maintenance (i.e., removal of low-permeability soil) to increase infiltration through the bottom of the pond. Technical information on maintenance activities associated with infiltration structures is included in Appendix F to this report.

5.5.4 Beneficial and Adverse Impacts

As mentioned previously, the BMP will include activities such as: (i) planting trees around Pond 9-2 and along the riprap discharge channel to increase shading; and (ii) performing operational activities to maximize the infiltration through the bottom of the pond. For example, it may be necessary to drain the pond periodically and remove fine sediment material that can clog the bottom of the pond and reduce infiltration. Direct benefits should result from these types of practices including amelioration of water temperature impacts in Wells Branch and increasing the amount of infiltration through the pond bottom. Water that infiltrates through the bottom of Pond 9-2 and discharges into Wells Branch through wetland seeps will be at a lower temperature as compared to the temperature of the water that discharges through the pond riser structure. Additionally, the infiltrated water will recharge ground water in the vicinity of the pond. Ground water beneath Pond 9-2 eventually discharges into either Wells Branch or Severn Run. Therefore, the base flow in Wells Branch and Severn Run will be augmented by BMP in Pond 9-2.

If properly designed, there should not be any adverse impacts associated with using BMP for Pond 9-2.

5.5.5 Costs

It is estimated that the cost of the alternative will be relatively small compared to the other alternatives. The estimated annual costs of this alternative are about $15,000. The anticipated costs consist mainly of operational and maintenance costs to remove fine sediment from the bottom of Pond 9-2 in order to maximize infiltration. Additionally, there will be minor capital costs for the purchase and installation of shade trees along the corridor of the riprap-lined discharge from the pond into Wells Branch. Engineering costs should also be minimal.

5.5.6 Schedule and Implementation

The use of BMP in the Cell 9 pond area could begin once the pond is constructed. Shade trees could be planted along the riprap outlet channel once the pond embankment and surrounding areas are vegetatively stabilized. During development of Cell 9, Pond 9-2 will have limited infiltration potential due to clogging of the pond bottom from the sediment load carried in the discharge water into the pond. After soil stabilization of the final cover, the pond will be converted to a stormwater management pond (i.e., removal of the low-flow devices), and infiltration through the pond bottom should improve. Soil stabilization of the final cover will require about two years.

6. ALTERNATIVES FOR MITIGATION OF DIRECT IMPACTS TO WETLANDS

6.1 Introduction

As discussed in the previous sections, appropriate and practicable compensatory mitigation is required for unavoidable adverse impacts (either direct or indirect) which remain after all appropriate and practicable minimization actions have been exhausted. In determining compensatory mitigation, the functional values lost by the resource to be impacted must be considered. Generally, in-kind mitigation is preferable to out-of-kind mitigation. No suitable in-kind mitigation other than the Devonshire Site (Alternative I, Section 7.4) has been identified in the Severn Run watershed. However, because alternatives other than in-kind replacement may be preferred, out-of-kind alternatives have also been developed to mitigate direct impacts to wetlands.

Two alternatives for mitigation of direct impacts to wetlands have been identified in the site vicinity and include:

- Alternative E - dedication of a conservation easement in Wells Branch; and

- Alternative F - dedication of a conservation easement in Jabez Branch.

The purpose, feasibility, beneficial and adverse impacts, costs, and schedule and implementation of each of these alternatives are discussed in detail in this section of the report.

6.2 Alternative E - Conservation Easement in Wells Branch

6.2.1 Overview

Alternative E is the establishment of a conservation easement in Wells Branch from the MLF property line to Gambrills Road, a distance of about 1,150 ft. The conservation easement is essentially the establishment of a riparian corridor on both sides of Wells Branch and associated wetlands (see Figure 11). The width of the riparian corridor would be adjusted to exclude existing dwellings. Only property, and not homes, would be included in the easements, and only that property willingly placed into easements would be considered (i.e., there would be no condemnation of property).

Within the proposed riparian corridor along Wells Branch, the topography south of Wells Branch is generally steeper than the topography north of Wells Branch. The steep slopes south of Wells Branch are generally within a 150-ft distance from the upland/wetland boundary. The wetlands along Wells Branch vary in width from about 30 ft to 150 ft. Therefore, a total wetland buffer of 350 to 400 ft would incorporate both the steep slopes and the wetlands. The Maryland Wildlife Administration has been consulted relative to the proposed width of the buffer. Although the exact width of the buffer necessary to protect the stream cannot be determined until that agency has reviewed drawings and conducted a site visit, it appears that the 350 to 400-ft width is a reasonable estimate at this time.

6.2.2 Purpose

The purpose of establishing a riparian corridor in Wells Branch is to provide long-term protection for this valuable natural resource. Such protection would be achieved by establishing a perpetual easement that includes Wells Branch, the wetlands associated with Wells Branch, and slopes adjacent to Wells Branch.

6.2.3 Feasibility

The riparian corridor along Wells Branch from the MLF property boundary to Gambrills Road is feasible if property owners are amenable to granting an easement to AAC. As mentioned previously, AAC will not condemn property to procure the easement, but will work with property owners to establish the conservation easement.

6.2.4 Beneficial and Adverse Impacts

Protection of the slopes adjacent to the stream would maintain the integrity of the stream and wetlands by precluding construction activities in this area. The quantity of pollutants, such as sediment and nutrients, entering the stream would be reduced. The easement would also remove an existing contributor of pollutants (i.e., a small duck pond adjacent to one of the existing dwellings). Approximately three acres of wetlands and six acres of upland would be protected from development pressures as a result of acquiring the easement.

No undesirable consequences are anticipated as a result of establishing the riparian corridor. The slopes adjacent to the stream and wetlands are stable, and therefore, no bank stabilization activities will be required. No construction will be required as part of establishing the easement.

6.2.5 Cost

This mitigation alternative would involve establishing a conservation easement on approximately three acres of wetland and about six acres of upland. AAC would be responsible for negotiating a settlement with the property owners. This process could begin immediately upon approval of the mitigation package by DNR and the Corps. The estimated cost for this alternative is $90,000.

6.2.6 Schedule and Implementation

The negotiation process with the property owners could begin immediately upon approval of this mitigation report. The process could be completed in less than one year. The stream restoration (i.e., removal of the duck pond) could also be performed during this time.

6.3 Alternative F - Dedication of Conservation Easement in Jabez Branch

6.3.1 Overview

Alternative F is similar to Alternative E and involves the establishment of an approximate 20-acre conservation easement (riparian corridor) in the Jabez Branch watershed. The easement would be established to maintain the integrity of the stream from future potential construction activities. The easement would include a portion of the "left fork" of Jabez Branch, and adjacent floodplain and steep slopes (see Figure 12). AAC is currently evaluating the area that could potentially be included in the easement. The easement may include a portion of the Holladay Park property. The use of this property as a mitigation alternative was discussed in a 1992 meeting between Maryland DNR, AAC, GeoSyntec, and Greenhorne & O'Mara. An evaluation of the Holladay Park property is included in Appendix H. The location of the Jabez Branch easement is shown on Figure 12.

6.3.2 Purpose

The purpose of establishing the Jabez Branch conservation easement is to mitigate for the direct impacts of filling the wetlands for construction of Cell 9. This is an appropriate mitigation strategy for the reasons presented below.

- The WET function and value assessment conducted for the existing wetlands at Cell 9 suggests that the wetlands probably perform floodflow alteration and sediment stabilization functions. WET assigned high probability ratings for these functions. Floodflow alteration and sediment stabilization are two important functions of the floodplain of Jabez Branch. These two functions (and other functions such as nutrient retention and production export) are important in maintaining the fisheries values of the stream. These functions directly help maintain the integrity of the stream.

- The conservation easement will protect the stream from physical disturbances that may directly alter the ability of the stream to perform water quantity and quality functions. Although the area of the proposed conservation easement is primarily floodplain and steep slopes, and therefore can not be developed under current environmental laws and regulations, permittable activities such as road crossings and utility installations could potentially be proposed in the future. These activities would directly impact the stream by either an increase in sediment load in the stream, reduction in floodflow alteration capacity, or an increase in water temperature due to reduction of forest cover.

- Jabez Branch is classified as Class IV (Recreational Trout Waters) by Maryland DNR. To protect or restore Jabez Branch for this use classification requires maintenance of overall water temperature impacts criteria, including suspended sediment, dissolved oxygen, turbidity, pH, and temperature. The Maryland DNR is attempting to restore a native population of trout in Jabez Branch, and water temperature in particular is critical to maintain a trout population. The conservation easement is one action that could help maintain the water temperature impacts and thereby to protect the stream for its use classification.

6.3.3 Feasibility

The proposed easement is technically feasible. The easement would place restrictions on the use of the property, and exclude any future development, silviculture, or agricultural activity on the land. The feasibility of establishing the easement is primarily a function of the willingness of the property owners to support such an easement. Much of the proposed easement area is floodplain and steep slopes, which limits any potential future construction activities. However, the easement would also restrict or regulate activities that might otherwise take place in these areas, such as utility installations and road crossings.

6.3.4 Beneficial and Adverse Impacts

Protection of the floodplain and adjacent slopes will protect the stream from construction activities and prevent additional pollutant loadings to the stream. By minimizing water temperature impacts in the stream, it can be protected for recreational trout use classification. Precluding development activities in this area will also minimize water temperature impacts by reducing thermal loading. Not only will the stream remain shaded, but part of the contributing watershed will also remain shaded.

No adverse impacts are anticipated for this alternative.

6.3.5 Costs

This mitigation alternative would involve the placement of conservation easements on approximately 20 acres of forested land, precluding future development activities. AAC does not propose purchasing the land. The land would continue to be privately owned, and establishing the easements would be voluntary (the County will not

condemn land to establish the easements). The cost to establish the easements has not been confirmed, but will be a result of negotiations with the property owners. AAC estimates the cost of the easement to be in the range of $100,000 to $200,000.

6.3.6 Schedule and Implementation

AAC anticipates that the conservation easements could be negotiated with the property owners, and the easements recorded with the deeds, within one year from approval of the Corps permit.

7. ALTERNATIVES FOR MITIGATION OF INDIRECT IMPACTS TO WETLANDS

7.1 Introduction

As discussed in previous sections, appropriate and practicable compensatory mitigation is required for unavoidable adverse impacts (either direct or indirect) which remain after all appropriate and practicable minimization actions have been exhausted. Four alternatives for mitigation of indirect impacts have been identified in the site vicinity and include:

- Alternative G - reforestation of the MLF site to the maximum extent practicable;
- Alternative H - removal of Cell 3 and construction of an infiltration basin;
- Alternative I - either the creation of wetlands at the Devonshire site or restoration of a portion of the Jabez Branch; and
- Alternative J - dedication of the former Denton property as a conservation easement.

The purpose, feasibility, beneficial and adverse impacts, and schedule and implementation of each of the four alternatives are discussed in this section of the report.

7.2 Alternative G - Reforestation of the MLF Site

7.2.1 Overview

Alternative G involves re-forestation of the MLF site. After the MLF is closed, the site will be reforested to the maximum extent possible.

The reforestation will occur in those areas of the landfill where MSW has not been placed. The main areas where reforestation will occur are shown in Figure 7 and include the following: (i) east of Cell 567 and Cell 1; (ii) in the vicinity of Cell 3; and (iii) along access roads throughout the landfill. The total site area is 567 acres and the estimated area where landfilling has not occurred on the site is 300 acres. Approximately 90 percent of this area is already covered with trees and vegetation and will not require additional reforestation. Areas within the MLF property that potentially are available for reforestation are estimated to be 30 acres.

7.2.2 Purpose

The purpose of site reforestation is to increase the amount of vegetative cover at the MLF site. As shown in Table 2, the vegetative cover will serve the following purposes: (i) providing habitat for wildlife; (ii) increasing the potential for recharge on the site; and (iii) increasing sediment stabilization at the site.

7.2.3 Feasibility

The reforestation of the MLF site to the maximum practical extent is a feasible alternative. The only areas that will not be forested after completion of landfilling at the MLF site will be the locations of the refuse cells and roads that will need to remain for maintenance activities. The remaining areas can be reforested through a program of tree and shrub planting. AAC currently has a fund set aside to assist in reforesting sites in the county. Therefore, the funds should be available for reforestation of the MLF site.

7.2.4 Beneficial and Adverse Impacts

Except for the capped landfill cells, the landfill will be reforested to the maximum extent possible when the landfill is closed. A significant ecological benefit to this area will result by restoring habitat for terrestrial wildlife. The area will be enhanced for infiltration of precipitation, and thereby, provide an improved groundwater recharge function. The reforested area will also provide soil stabilization functions, thereby, reducing the sediment load discharged into Wells Branch. The reforestation will minimize the operation and maintenance requirements that AAC will have to perform after the landfill is closed.

No adverse impacts have been identified in reforesting the MLF site.

7.2.5 Costs

The estimated cost of this alternative is $326,700. This cost assumes 30 acres of land are reforested at a cost of $0.25 per square ft. Once the Corps permit is issued, Maryland DNR will be consulted regarding recommendations on plant species and their availability.

7.2.6 Schedule and Implementation

This work will be done after the entire landfill is closed. The exact year is not known at this time; however, a 20-year time frame is a reasonable estimate.

7.3 Alternative H - Removal of MSW from Cell 3 and Construction of an Infiltration Basin

7.3.1 Overview

Alternative H is the removal of MSW from Cell 3 and the construction of an infiltration basin. The quantity of waste that would need to be removed from Cell 3 is approximately 30,000 yd^3. This corresponds to approximately 24,000 tons of material to be moved, based on an assumed in-place unit weight of 1,600 lbs/yd^3. It is assumed in this report that the MSW removed from Cell 3 would be placed in Cell 8.

The sequence of events that will occur at the MLF to support construction of an infiltration basin in the area of Cell 3 are as follows:

- closure of MSW Cells 1, 2, and 4;
- construction of sediment control pond;
- stabilization of final cover system for Cells 1, 2, and 4; and
- design and construction of an infiltration basin.

A conceptual design of the Cell 3 infiltration basin is shown on Figure 13. Additional information on the evaluation of Cell 3 as an infiltration basin and the removal of MSW from Cell 3 is provided in Appendix I.

7.3.2 Purpose

The purpose of the removal of MSW from Cell 3 would be to: (i) eliminate an unlined landfill cell; (ii) eliminate the potential generation of landfill leachate; and (iii) reclaim the area for the

construction of an infiltration basin to recharge the shallow ground-water system (i.e., Zone 2 and Zone 3) in the headwaters of the northwest tributary of Wells Branch. Wetland function benefits that can be replaced from the construction of an infiltration basin in the location of Cell 3 are presented in Table 2.

7.3.3 Feasibility

Mining of MSW is a demonstrated technology that is being performed at many locations throughout the United States. Furthermore, infiltration basins are also a demonstrated and reliable technology. Therefore, Alternative H is a feasible alternative for mitigation of impacts associated with the filling of wetlands during construction of Cell 9.

Approximately 30,000 yd^3 of MSW will be removed from the Cell 3 location. The waste will be selectively mined to remove any recyclable material and the remaining waste will be placed in Cell 8 for disposal. Samples will be collected from the soil beneath the existing unlined cell to characterize the subsurface material in that area. After the subsurface investigation, an infiltration basin will be constructed on that location. The infiltration basin will be designed and constructed in such a way to maximize the amount of surface water that can infiltrate the subsurface. Infiltrated water will recharge the ground-water system in the area of the headwaters of the northwest tributary of Wells Branch. Ground water in this area provides base flow support to Wells Branch.

7.3.4 Beneficial and Adverse Impacts

The potential benefits associated with removal of MSW from Cell 3 are as follows:

- elimination of unlined landfill cells, which can potentially cause ground-water contamination;
- reclamation of land for alternative uses (i.e., mitigation); and
- reduction of solid waste management costs by eliminating landfill closure or post-closure costs.

The potential adverse impacts include the following:

- health and safety concerns;
- nuisance factors; and
- soil contamination beneath Cell 3.

Each of the beneficial and adverse impacts is briefly discussed in the following paragraphs.

Beneficial Impacts

Elimination of Unlined MSW Landfill Cell - Removing MSW from Cell 3 will reduce the total area of unlined landfill cells at the MLF site. The removal of Cell 3 will result in an overall improvement at the site, because unlined landfill facilities have a greater potential to cause ground-water contamination than lined facilities. It should be noted that the current plan is to close Cell 3 by installing a final cover system. (GeoSyntec is currently preparing a Phase III permit application on AAC's behalf that includes removal of MSW from Cell 3. Removal of MSW from Cell 3 is contingent on MDE's approval of the Phase III permit.) The final cover system will consist of the following components:

- cover soil;
- drainage layer;

- geomembrane layer; and
- subgrade soil layer.

The final cover system will significantly reduce the possibility that ground-water contamination will be caused by the unlined landfill cells. However, removal of the MSW will be a more permanent solution for at eliminating the potential source of contamination.

Reclamation of Land for Alternative Uses - Removal of the MSW in Cell 3 will allow the four acres that Cell 3 currently occupies to be utilized for other purposes. In addition to using the land for an infiltration basin, more land will be available for reforestation, with the auxiliary benefit of enhanced infiltration of precipitation. The additional infiltration will recharge the ground-water system and provide base flow support to Wells Branch. Other beneficial uses can also be made for the reclaimed land (e.g., composting).

Reduction of Solid Waste Management Costs - Removal of MSW from Cell 3 will reduce the operation and maintenance costs for the landfill. If a cover system is installed on Cell 3 as currently planned, it will have to be maintained for years. The costs associated with maintaining an infiltration basin are assumed small in comparison with the costs required to maintain a solid waste management cell.

Potential Adverse Impacts

The removal and relocation of MSW from Cell 3 would require removal of approximately 50,000 yd^3 of in-place material; an estimated 20,000 yd^3 may be reclaimed as cover soil, and the remaining 30,000 yd^3 is MSW. It is estimated that removal of the cover soil will take about 7 days (i.e, based on an average removal rate of 3,000 yd^3 per day). It is estimated that removal of MSW from Cell 3 and placement in Cell 8 will take about 20 days (i.e, based on an average removal rate of 1,500 yd^3 per day), depending upon weather conditions.

Health and Safety Risks and Nuisance Factors - An operation of this nature has potential risks and nuisance factors to landfill personnel and the surrounding community. The risks and nuisance factors may include: exposure to odors and other airborne contaminants, such as landfill gases and dust; fumes and particulates from landfill equipment and vehicular traffic; noise as a result of the excavation operation; opening the cell to rainfall and leachate development which may result in ground-water contamination; exposure to vectors such as birds, insects, and rodents; and the possibility of encountering hazardous materials during excavation.

These risks are usually associated with the operation of any landfill, but can be increased by the excavation of previously-disposed solid waste. The potential risks are discussed in greater detail in a report entitled: "*Environmental and Economic Feasibility of Reducing the Elevation of Cells 5, 6, and 7 at Millersville Landfill*" prepared by Gershman, Brickner and Bratton, Inc. (GBB) in May 1992. However, there are several factors that make the removal of MSW from Cell 3 substantially different from the removal of MSW from Cell 567. The reasons that the potential risks and nuisance factors would be greatly minimized for removal of MSW from Cell 3, in comparison to removal of MSW from Cell 567, are listed below:

- Cell 3 is at a lower elevation than Cell 567 (i.e, it is shielded from the winds);

- Cell 3 contains a single lift of waste and Cell 567 contains multiple lifts;

- Cell 3 contains a much smaller volume of waste than would have been removed from Cell 567 (i.e., 30,000 yd^3 compared to 3,000,000 yd^3);

- the Cell 3 removal operation would require less time (i.e., less than one month) in comparison to the Cell 567 removal (i.e., 19 to 52 months);

- the age of waste in Cell 3 will result in less generation of gas (i.e., Cell 3 is 13 years old and the peak gas generation rate has probably already passed) than Cell 567 (i.e., Cell 567 is only 5 years old and the gas generation rates are increasing); and

- Cell 3 is dry (i.e., no potential leachate management problem) and Cell 567 is believed to contain leachate.

Since health and safety precautions are an important factor during the excavation, a formal health and safety plan (HASP) will need to be implemented during the removal operation. The HASP should be prepared in accordance with applicable OSHA regulations contained in 29 CFR 1910.120, and will, at a minimum, include:

- engineering controls (e.g., daily covering requirements for any exposed waste using plastic sheeting or other appropriate material and proper run-off control);

- air quality monitoring (e.g., dust, combustible gas, volatile organic compounds);

- personal protection safety equipment (e.g., dermal protection, respirators if necessary); and

- contingency planning to address potential emergencies or unexpected conditions (e.g., standby of fire department).

Soil Contamination - Another potential risk associated with removal of Cell 3 MSW is soil contamination beneath Cell 3. The potential exists that soils beneath Cell 3 have been contaminated by leachate. However,

the likely potential of soil contamination should not be significant based the following reasons:

- MLF leachate typically contains low levels of volatile organic compounds (VOCs), and VOCs move rapidly through the subsurface;
- VOCs do not attenuate on soils readily, particularly sandy soils; and
- Cell 3 is dry and leachate impacts should be minimal.

To confirm the existence, or absence, of soil contamination, a brief soil sampling program should be implemented prior to excavating MSW from Cell 3.

7.3.5 Costs

The cost estimate for Alternative H is broken down into costs associated with removal of the MSW from Cell 3 and costs associated with construction of the infiltration basins. The construction costs for removing MSW from Cell 3 is about $930,000 (i.e., including lost revenues associated with lost tipping fees) and the engineering costs are about $15,000. The construction costs for the infiltration basins are about $101,700 and the engineering costs are $7,000 (see Table 4).

In addition to the construction and engineering costs associated with design and construction of removal of MSW from Cell 3, and the design and construction of an infiltration basin, there will be a potential savings associated with removal of MSW in Cell 3 including:

- the cost of final grading and stabilization;
- the cost of capping Cell 3 in-place;

- the installation of a gas recovery system; and
- the post-closure costs associated with Cell 3.

The potential cost savings associated with removal of Cell 3 MSW are about $566,400 (see Tables 5 through 8). Therefore, the total estimated cost of this alternative is $487,300.

7.3.6 Schedule and Implementation

The removal of MSW from Cell 3 and the construction of an infiltration basin can be implemented once MDE approves the Phase III permit application, and construction documents are prepared. AAC anticipates that removal of MSW from Cell 3 could being as early as mid-1994.

7.4 Alternative I- Wetland Creation at Devonshire or Stream Restoration in Jabez Branch

7.4.1 Overview

Alternative I will consist of either the creation of forested and scrub-shrub wetland, or stream restoration in Jabez Branch. The wetlands would be established on property owned by AAC, referred to as the Devonshire site, located in the community of Devonshire near the Millersville Elementary School (see Figure 1). If the Devonshire mitigation site is not preferred, Alternative I would consist of stream restoration on the "left fork" of Jabez Branch (see Figure 14). The Jabez Branch project would be an extension of a project proposed by the Maryland State Highway Administration (SHA).

The Devonshire site is the location of a stormwater detention basin constructed in the 1970's. The site was modified in 1992 by the County

for the purpose of establishing wetlands within a portion of the site. This work was funded by a grant from the MDE. The purpose of the retrofit was to improve water-quality benefits of the facility. The project was not related to any wetland mitigation activities that may have been required by the regulatory agencies, and does not appear to be any conflict with regulatory requirements. The proposed wetland creation project would expand on the work performed in 1992.

It is noted that wetland creation at the Devonshire site would mitigate direct wetland impacts and is considered an in-kind mitigation project. However, the Devonshire site is included in this section on indirect wetland impacts as an alternative to the Jabez Branch stream restoration project. Of the two projects, AAC prefers the mitigation of Jabez Branch project, for the reasons discussed herein. Appendix J contains additional background information on the Devonshire mitigation alternative.

The stream restoration of Jabez Branch proposed by the SHA begins west of Maryland Route 3 and extends 1,100 ft downstream. Most of the severe erosion is within this distance. However, the SHA project does not include the removal of an existing deteriorating concrete channel immediately upstream from the SHA stream restoration project (see Figure 14). The concrete channel is within a relocated stream channel presumably constructed by the SHA when Maryland Route 3 was constructed. The concrete channel has been undermined, and sections of the channel have collapsed. This alternative would involve diverting the stream to its natural channel and filling in the artificially-created channel or implementing bioengineering techniques (e.g., root wad) on the existing stream channel.

Of the two alternatives presented in this section of the report, AAC prefers the restoration of the Jabez Branch over the creation of wetlands on the Devonshire site. The reasons are as follows: (i) Jabez Branch has historically supported a naturally reproducing population of trout, the only natural trout stream in the coastal plain of Maryland; (ii) the

Maryland DNR is currently trying to restore the trout population in the "left fork" of Jabez Branch, and the mitigation project will provide improved fisheries habitat by stabilizing a severe bank erosion problem in the headwaters of the stream; (iii) Jabez Branch is a tributary of Severn Run, an anadromous fish spawning stream, particularly for yellow perch, and improvements to the water quality of Jabez Branch will directly improve the water quality of Severn Run; and (iv) although the mitigation at the Devonshire site will improve the wildlife habitat at the mitigation site and will provide an unquantified increase in baseflow to the headwaters of Severn Run, it will not significantly improve water quality downgradient of the site, as the stormwater management facility at the Devonshire site currently performs water quality functions.

7.4.2 Devonshire Site

7.4.2.1 Purpose

The purposes of the Devonshire mitigation project are as follows: (i) to enhance the site's habitat for songbirds, wading birds, amphibians, and invertebrates that utilize or require forested wetland and emergent scrub-shrub habitats; (ii) to improve the site's water quality functions including temperature repression; and (iii) to provide enhancement to the export production function of the wetlands by installing a less constricted outlet. In addition, the Devonshire site would provide AAC with an in-kind mitigation site.

7.4.2.2 Feasibility

This alternative involves the creation and enhancement of wetlands within an existing stormwater management facility, comprising approximately 3.5 acres. To create and enhance wetlands at this site will require increasing the amount of water available to support the

wetlands hydrologically. This will involve creating a ground-water connection and improving the distribution of surface water across the site. To make the ground-water connection will involve the excavation of about 2.5 ft across the existing stormwater management facility, beginning at the toe of the existing slope. This depth would intercept the ground-water flow emanating from the adjacent agricultural field so that it can then be distributed across the site. This depth would also extend to the depth of the fluctuating water table through the site. The exact depth of cut will be evaluated during the design phase of the project and after water-level data are collected during the Winter and Spring of 1994. Figure 15 presents a conceptual design for the Devonshire mitigation site.

To maximize the effectiveness of the available hydrology, it will also be desirable to alter the distribution of the surface-water runoff from the storm drain outfall. It has also been recommended by the Maryland DNR and the Corps that a small stilling basin be constructed at the outfalls to serve as forbays to capture sediment and associated pollutants.

The Maryland DNR has recommended that the downstream end of the site be contiguous with the stream system to the extent practicable. To make this grade connection will require removal of the existing concrete outfall structure and deepening of the existing swale downstream of the facility. Spot elevations downstream of the facility will be required to determine this downstream distance. It does not appear at this time that a significantly amount of additional right-of-way will need to be acquired for these improvements.

For the site to retain its function as a stormwater management facility will require the design and construction of an alternative outlet structure that provides for detention of the runoff while minimizing the effect of truncating the mitigation area from the natural system. An example of this type of design might be a riprap or gabion structure.

The Devonshire site was visited on three occasions in March 1994 to evaluate hydrologic conditions at the site. The site visits revealed that ground water was at or near the surface in two monitoring wells that were installed in December 1993 and that water was flowing over the concrete weir at the downstream end of the site. Flow was estimated to vary from 0.06 cubic ft per second (cfs) to 1.5 cfs. However, it should be noted that rainfall in March was well above the March average. The information obtained from the site visits supports the assumption that adequate hydrology can be provided early in the growing season to support a seasonally saturated/flooded-water regime.

7.4.2.3 Beneficial and Adverse Impacts

The primary benefits of the Devonshire mitigation project are the 3.5 acres of wetlands created and the associated benefits of the wetlands to the overall hydrology of the watershed. Presently, the runoff from the site is conveyed to the concrete outfall structure via a shallow swale. However, water flows over the weir only in late winter, early spring, and during heavy rainfall events. The proposed system hydrology will allow for water to flow out of the facility more regularly, thereby improving base flow conditions downstream. The facility will also provide shading of the runoff entering the site from the storm drain outfall.

No adverse impacts have been identified in making the proposed improvements to the stormwater management facility. The facility will be similar in nature to that which presently exists, albeit wetter and vegetated with trees and shrubs. Periodic maintenance may be required to the outfall structure and stilling basin, to ensure that sediment has not inhibited the proper functioning of the facility.

7.4.2.4 Costs

The estimated cost for grading and planting within the Devonshire site is about $200,000. This cost estimate includes the cost of replacing the outfall structure, the additional grading to tie the mitigation site elevation into the swale downstream from the site, and engineering costs.

7.4.2.5 Schedule and Implementation

This project will require the purchase of additional right-of-way downstream from the site in order to deepen and widen the swale. Therefore, construction of the mitigation project will probably not start for six months to one year after AAC obtains the Corps permit.

7.4.3 Jabez Branch

7.4.3.1 Purpose

The purpose of the Jabez Branch stream restoration is to correct an erosion problem in the stream that has resulted in a large sediment load being discharged into the stream. Stream restoration will involve either the possible relocation of the stream to its natural channel or removal of a portion of a concrete swale and stabilizing the existing stream bank using bioengineering techniques (see Figure 14).

7.4.3.2 Feasibility

Relocating the stream to its natural channel involves the removal of fill material from the natural channel at the upstream end of the project, adjacent to a driveway that crosses the stream, possibly widening the stream to provide the cross-sectional area necessary to

convey storm flows, and clearing of an approximate 50-ft wide area for construction access. However, additional study will be required to determine if any changes to the natural channel geometry are warranted, given changes in land use and additional runoff that now exists in the watershed.

Once the stream has been diverted back to its natural channel there will not be any flow in the stream in the location of the concrete channel except for water that flows down slope from Charles Hall Road and from an existing storm drain outfall. Accordingly, it may be feasible to fill the existing streambed with fill material and to vegetatively stabilize the fill; however, the existing storm drain would have to be extended to the natural channel location, and this may require further study. Material removed from the natural channel could be used as backfill for the existing channel. This would help protect Charles Hall Road and the BG&E transmission line pole from being undermined at the toe of the slope. The concrete in the existing channel could be either broken up and buried in-place, or removed from the site.

If relocation of the existing stream is not preferred, the existing stream banks could be stabilized using bioengineering techniques. This will involve the cutting of trees for use in root-wad construction. A minor amount of clearing will also be required for construction access. In addition, improvements to the downstream sections of the concrete channel will be required. These improvements may include removing the existing concrete section where undermining has occurred and placing riprap to stabilize the streambed and side slopes.

7.4.3.3 Beneficial and Adverse Impacts

Redirecting the stream to its natural channel will restore the natural stream geometry, thereby establishing a more stable hydraulic channel configuration. This will improve downstream conditions as well, and remove the source of the downstream erosion. If the stream is left

in its existing location and the streambed and side slopes are stabilized, erosion of the stream will also be corrected. This project will assist in removing the sediment source resulting from erosion of the streambed and side slopes and, thereby, improve fish habitat.

No adverse impacts have been identified for stream restoration project.

7.4.3.4 Costs

The estimated cost for the Jabez Branch restoration project ranges from about $100,000 to $150,000. This estimate includes costs for construction, revegetation and stabilization materials, and engineering.

7.4.3.5 Schedule and Implementation

AAC anticipates that the design and construction of this project could be completed within one year. The Jabez Branch project could begin immediately upon issuance of the Corps permit, should the Devonshire mitigation site not be preferred. The schedule for the Jabez Branch project will have to be coordinated with the SHA schedule for the downstream improvements to Jabez Branch.

7.5 Alternative J - Dedication of the Former Denton Property as a Conservation Easement

7.5.1 Overview

Alternative J is the dedication of the former Denton property as a conservation easement. The property is contiguous with the existing wooded area of the MLF (see Figure 6). The former Denton property encompasses an area of approximately 16.9 acres. A portion of this area

forms a catchment area which contributes to ground-water seeps which form the headwaters of the southwest tributary of Wells Branch. The drainage area contributing to the headwaters of Wells Branch is approximately 17.7 acres and includes a portion of the area upgradient and downgradient of the former Denton property. The former Denton property contains 10 acres of the 17.7-acre drainage area; the MLF property contains 5 acres. The remaining 2.7 acres is privately owned and is upgradient and adjacent to the former Denton property. Additional information on the former Denton property is provided in Appendix K.

7.5.2 Purpose

The purpose of the dedication of the property to conservation would be: (i) to preserve the infiltration capacity of the recharge area upgradient from the headwaters of the southwest tributary of Wells Branch; (ii) to promote enhancement of wildlife habitat through eventual reforestation of the property; (iii) to promote the production export function of the wetlands; and (iv) to promote enhancement of the sediment stabilization function of the wetlands.

7.5.3 Feasibility

The southern portion of the former Denton property is the catchment area for springs discharging to the wetlands in the southwest tributary of Wells Branch between Cell 8 and Cell 9. The catchment area is about 18 acres in size. Based on the subsurface information, it appears that the former Denton property is underlain by sandy soils which provide the proper media for infiltration of surface-water runoff into the ground-water system. As can be seen from the hydrogeologic section C-C′ (see Figure 5), precipitation falling on the former Denton property will infiltrate the sandy soils and recharge the perched water table (i.e., Zone 1). Ground water from the perched water table in Zone 1 discharges

as seeps, or springs, where the clay confining layer beneath Zone 1 intersects the land surface.

The catchment area, which encompasses the former Denton property, supplies a peak surface-water runoff of 46 cfs and 81 cfs from the two-year and ten-year 24-hour storm events, respectively. A portion of the precipitation infiltrates in Zone 1 on the former Denton property and discharges as seeps, or springs, to the wetlands in the headwaters of the southwest tributary of Wells Branch.

It is estimated, based on regional information, that six inches of rainfall infiltrates into the subsurface annually during an average year. Therefore, the catchment area allows an annual average of approximately 2,900,000 gallons of surface water to infiltrate the subsurface. This quantity contributes to the spring flow and surface-water flow in the southwest tributary of Wells Branch. Therefore, the former Denton property, if maintained as a conservation area, will continue to maintain the existing surface-water and ground-water flow conditions, and wetland conditions on the MLF site.

The quality of the surface water and ground water in the wetlands could potentially be impacted by any significant land use changes on the former Denton property.

7.5.4 Beneficial and Adverse Impacts

The potential hydrogeological benefits of preserving the former Denton property in its current undeveloped state for wetlands mitigation include:

- infiltration of precipitation and surface-water runoff to recharge the ground-water system in Zone 1; and

- maintaining ground-water discharge to the wetland ecological system in the southwest tributary of Wells Branch.

Upon completion of the reforestation of the property, the additional wooded area will extend the forested riparian corridor of the northwest tributary and, thereby, enhance wildlife habitat, sediment stabilization, and production export functions of the wetlands.

Based on information presented in this report, AAC believes that dedicating the former Denton property to preservation in its current undeveloped state would have a positive impact as part of the mitigation plan for the MLF site. If the site is reforested, it will offer additional wildlife habitat and promote the enhancement of other wetland functions as well as preserve the recharge area. Recharge in the catchment area will move through the subsurface and discharge in the headwaters of Wells Branch. The added discharge will serve to maintain the wetlands between Cells 8 and 9 and provide base flow support in Wells Branch.

No adverse impacts have been identified with the dedication of a conservation easement on the former Denton property.

7.5.5 Costs

The former Denton property was purchased by AAC in December 1992 at a cost of $375,000. The purchase was made to expand the landfill perimeter buffer at this particular location. The highest and best use for the property, according to Real Property Consultants, is to subdivide the parcel into eleven lots. In the event that water service is provided to this locale, the feasibility of developing a subdivision is improved and thus the market value of the property could increase. Dedication of the property to conservation would, of course, eliminate it from any possible future development and thereby result in devaluation of the property.

The only additional cost to AAC beyond the original purchase price would be the transaction costs associated with the execution of conservation easements and minor demolition of buildings, fences, and accessory roads. These costs are estimated at $7,500.

With respect to reforestation, it is noteworthy that this property, upon execution of the conservation easement to either the Severn River Land Trust or Maryland Environmental Trust, would be eligible for access to AAC's reforestation funds. There are currently $248,000 available in the fund. The monies therein are allocated at $0.25 per square ft basis. The entire 16.9 acres of the former Denton property, less the BG&E right-of-way and existing dwelling, could be reforested at a cost of $184,000. Therefore, the total estimated cost of the former Denton property mitigation site is about $191,500.

7.5.6 Schedule and Implementation

This alternative could be implemented immediately upon issuance of a Corps permit. If the easement is executed in 1994, demolition and planting could begin in late 1994 and early 1995, respectively.

8. SUMMARY AND RECOMMENDATIONS

8.1 Summary

Anne Arundel County (AAC) is in the process of obtaining a Phase III permit to operate the MLF. As part of the permitting process, it was determined that approximately 1.8 acres of wetlands will be impacted by construction of Cell 9. Wetland impacts as a result of construction of Cell 8 have been completely avoided. Generally, the Corps requires replacement of wetlands on a 2 for 1 basis. Therefore, as Cell 9 will result in the filling of 1.8 acres of wetlands, 3.6 acres of wetlands would normally be developed. This report has been prepared to describe the avoidance, minimization, and mitigation alternatives developed for the site because of wetland impacts during construction of Cell 9.

Section 404 of the Clean Water Act requires that all adverse impacts be evaluated before dredged or fill materials can be discharged into waters of the United States, including wetlands. Direct disposal of dredged on fill materials may destroy or significantly alter natural habitats and decrease the diversity of plant and animal species found in those waters. The decision whether to issue a Corps permit for excavation, or filling, of wetlands is based on an evaluation of the probable impacts, including cumulative impacts, of the proposed activity and its intended use in the public interest. The sequencing of mitigation strategies described below is to be followed in determining the type and level of mitigation necessary to demonstrate compliance with the Guidelines.

- **Avoidance.** A Corps permit is to be issued only for the least environmental damaging practicable alternative. No discharge is to be permitted if there is a practicable alternative to the proposed discharge which would have less impact to the aquatic ecosystem, so long as the alternative does not have other significant environmental consequences. Compensatory mitigation

may not be used as a method to reduce environmental impacts related to the evaluation of the least damaging alternative.

- **Minimization.** Appropriate and practicable steps to minimize the adverse impacts are required through project modifications and permit conditions.

- **Compensatory Mitigation.** Appropriate and practicable compensatory mitigation is required for unavoidable adverse impacts which remain after all appropriate and practicable minimization has been required. In determining compensatory mitigation, the functional values lost by the resource to be impacted must be considered. Generally, in-kind mitigation is preferable to out-of-kind mitigation. The likelihood of success of the mitigation project must also be considered.

AAC has fully complied with the mitigation sequencing process described above. This report describes the avoidance, minimization, and compensatory mitigation program followed by AAC during the permitting process. The program consists of ten alternatives each comprising one the following three categories: (i) minimization alternatives; (ii) alternatives for mitigation of direct impacts to wetlands; and (iii) alternatives for mitigation of indirect impacts to wetlands. The ten alternatives considered in this report are:

- *Alternative A:* Alternative A is the conversion of Pond 8-1 to an infiltration basin.

- *Alternative B:* Alternative B consists of the construction of infiltration trenches near Cell 9.

- *Alternative C:* Alternative C involves the use of an environmentally sensitive stream crossing structure between Cells 8 and 9.

- *Alternative D:* Alternative D is the utilization of best management practices (BMP) in Pond 9-2 to attenuate potential temperature impacts to Wells Branch and to maximize potential infiltration through the pond bottom.

- *Alternative E:* Alternative E consists of the establishment of a conservation easement in Wells Branch.

- *Alternative F:* Alternative F consists of the establishment of a conservation easement in the Jabez Branch watershed.

- *Alternative G:* Alternative G involves reforestation of the MLF site.

- *Alternative H:* Alternative H is the removal of MSW from Cell 3 and the construction of an infiltration basin in the location of Cell 3.

- *Alternative I:* Alternative I consists of either the creation of forested and scrub-shrub wetlands or stream restoration in Jabez Branch.

- *Alternative J:* Alternative J is the utilization of a portion of the former Denton property for a conservation easement.

8.2 Recommendations

It is anticipated based on existing surface and subsurface data that hydrologic and hydrogeologic conditions are favorable for all of the mitigation alternatives. Based on the hydrologic/hydrogeologic and environmental benefits, cost, and the schedule for implementation, all ten alternatives should be implemented. Upon implementation of these alternatives, the mitigation project has a high likelihood of success for replacing the function benefits lost in the filling of 1.8 acres of wetland in the Cell 9 area.

TABLE 3

MINIMIZATION AND MITIGATION ALTERNATIVES COSTS
MILLERSVILLE SANITARY LANDFILL

ALTERNATIVE	COST
A - Conversion of Pond 8-1 to an infiltration basin	$ 23,450
B - Construction of infiltration trenches near Cell 9	17,470
C - Environmentally sensitive stream crossing structure between Cells 8 and 9	108,000
D - Use of BMP in Pond 9-2	15,000(1)
E - Conservation easement in Wells Branch	90,000
F - Conservation easement in Jabez Branch	150,000
G - Reforestation of the MLF site	326,700
H - Removal of MSW from Cell 3 and construction of infiltration basin	487,300
I - (a) Creation of wetlands at Devonshire site (b) Stream restoration in Jabez Branch	200,000 125,000
J - Conservation easement on a portion of Denton property	191,500(2)
ESTIMATED TOTAL COST OF ALL TEN ALTERNATIVES	**$1,534,420(3)**

Notes: (1) Estimated annual cost.

(2) Estimated cost does not include the cost to purchase the property; AAC purchased the property in 1992 for $375,000.

(3) Estimated total cost of all ten alternatives assumes that the Devonshire site alternative will not be implemented and the cost does not include the annual maintenance costs associated with the infiltration structures.

TABLE 4

COST ESTIMATE FOR INFILTRATION ALTERNATIVES MILLERSVILLE SANITARY LANDFILL

Option: Infiltration Basin 8-1

Excavation	(852 cy at $2/cy)	$ 1,704
Filter material	(852 cy at $15/cy)	12,780
Vegetative stabilization	(3333 sy at $0.25/sy)	834
Maintenance	(no additional cost - part of post-closure care)	-
Design Cost	(lump sum)	6,000
Contingency rate (10%)		2,132
		$23,450

Option: Infiltration Trench B-1

Excavation	(290 cy at $2/cy	$ 580
Aggregate	(290 cy at $25/cy)	7,250
Filter fabric	(1200 sf at $0.15/sf)	180
Observation Well	(6.5 ft at $40/lf)	260
Mobilization	(1 rig at $150/rig)	250
Maintenance	(semi-annual removal of 45 cy sediment at $2/cy)	90
Design Cost	(lump sum)	8,000
Contingency rate (10%)		860
		$17,470

Option: Infiltration Trench B-2

Excavation	(445 cy/$2/cy)	$ 90
Aggregate	(445 cy at $25/cy)	11,125
Filter fabric	(167 sf at $0.15/sf)	25
Observation well	(8 ft at $40/lf)	320
Mobilization	1 rig at $250/rig)	250
Maintenance	(semi-annual removal of 56 cy sediment at $2/cy)	110
Contingency Rate (10%)		1,270
		$13,990

TABLE 4 - (Continued)

Option: Infiltration Trench B-3

Excavation	(178 cy/$2/cy)	$ 360
Aggregate	(178 cy at $25/cy)	4,450
Filter fabric	(134 sf at $0.15/sf)	20
Observation well	(4 ft at $40/lf)	160
Mobilization	1 rig at $250/rig)	250
Maintenance	(semi-annual removal of 45 cy sediment at $2/cy)	90
Contingency Rate (10%)		530
		$ 5,860

NOTES:

1. Infiltration basin will be vegetatively stabilized along basin bottom to sides in accordance with Maryland Standards for permanent vegetative stabilization. Assume pond sides are already vegetatively stabilized and only lower 3 ft on pond sides will be disturbed.
2. Filter material for infiltration basin will consist of coarse sand.
3. Cost of excavation includes removal and proper disposal of sediment.
4. Routine inspections are part of post-closure maintenance and no additional costs are included.
5. Aggregate will have a d_{max} = 3 in., d_{min} = 15 in., and void ratio = 0.40. Aggregate will extend to top of infiltration trench.
6. Observation well will be a 4 in. diameter perforated PVC pipe with locking metal cap and foot plate.
7. Cost of observation well includes cost of drilling hole ($15/lf)/ cost of flush-joint casing ($10/lf), and cost of screen ($14/lf).

TABLE 4 - (Continued)

Option: Cell 3 Infiltration Basin

Excavation	(21,300 cy at $2/cy)	$ 42,600
Filter material	(1,130 cy at $15/cy)	16,950
Vegetative stabilization	(5,325 sy at $0.25/sy)	1,330
Engineering (estimate)		5,000
Combined spillway riser structure (estimate)		20,000
Riprap	(200 cy at $30/cy)	6,000
Design Cost	(lump sum)	7,000
Contingency rate (10%)		9,820
		$108,700

NOTES:

1. Combined spillway riser structure cost includes cost of aluminum coated corrugated metal pipe (ACCMP) riser and barrel, cost of installation, and construction of outfall basin. Riser pipe and barrel pipe cost based on using reinforced concrete pipe.

2. Riprap for outfall of combined spillway riser structure is No. 2 stone. Quantity of riprap includes inlet protection along banks of infiltration basin in areas of concentrated flow.

3. Cost of excavation does not include removing waste currently in Cell 3. Excavation cost is based on bottom of cell 3 at elevation 132 ft.

4. Total cost does not include cost associated with mobilization or demobilization.

TABLE 5

FINAL GRADING AND STABILIZATION COSTS
MILLERSVILLE SANITARY LANDFILL

1.	Regrading Cost	
	a. 2 crews ($1,000/day x 10 day)	$ 10,000
	b. Vegetative Stabilization (5,325 sy x $0.25/sy)	1,400
	c. Equipment Maintenance	1,500
2.	Contingency Rate (10%)	1,300
	Total Final Grading and Stabilization Cost	**$ 14,200**

Note: Costs are based on an assumption that county owns the equipment necessary to complete the work and will not have to rent it; maintenance and operations fees are included in the cost estimate.

TABLE 6

CLOSURE COSTS
MILLERSVILLE SANITARY LANDFILL

1.	Construction of Final Cover	
	a. HDPE Composite Geomembrane Cap (4 acres x 43,560 ft^2/acre x \$0.30/ft^2)	\$ 52,300
	b. Geocomposite for drainage Layer and Gas Venting (4 acres x 43,560 ft^2/acre x \$0.60/ft^2)	105,500
	c. Topsoil (4 acres x 2 ft thickness x 1,613 yd^3/acre-ft x \$10/yd^3)	129,000
	d. Vegetation of Final Cover System (4 acres x \$1,300/acre)	5,200
2.	Drainage Control	3,000
3.	Project Surveying (lump sum)	30,000
4.	Mobilization/Demobilization (lump sum)	40,000
5.	Contingency Items (silt fence, temporary seeding, etc.)	5,000
6.	Excavation to Top of Subgrade (\$3/cy x 13,000 cy)	39,000
7.	Contingency Rate (10%)	41,000
8.	Design Cost (lump sum)	25,000
	Total Closure Cost:	**\$475,000**

EXECUTIVE SUMMARY

A wetlands delineation for the section of Wells Branch that lies between the Millersville Landfill and Gambrills Road was performed by Hogan Environmental Consultants on January 4 and 5, 1994. The Corps of Engineers Wetlands Delineation Manual (1987) was used. This investigation revealed that extensive wetlands are associated with Wells Branch within this stream reach. The wetlands are classified as palustrine scrub-shrub. Based on hydrology indicators present at the time of the investigation, a semipermanently flooded water regime was assigned to these wetlands.

The wetlands vary in width from about 30 feet to about 140 feet. The wetlands extend to the valley walls across the entire width of the floodplain. The stream averages 4 feet wide. Except for the upstream end of the study area, the stream is out of its banks, and braided channels exist throughout the wetland. In some areas more surface water than exposed land surface exists.

A small ponded area exists along the northern stream bank approximately 350 upstream from Gambrills Road in which the property owner has fenced in several domesticated ducks and geese. The natural wetland vegetation has been removed from this area.

The high degree of water and vegetation interspersion in this wetland system provides a significant water quality benefit for Wells Branch. Except for a few properties to the north of the wetland, a forested buffer presently exists along the slopes adjacent to the wetland. This buffer helps to maintain the integrity of the wetlands and preserve its water quality and wildlife value. Deer scat and grazing was evident in and adjacent to the wetland. Raccoon tracks were also observed, as were numerous song birds that use the wetland for food and cover.

1.0 SITE DESCRIPTION AND PURPOSE OF THE STUDY

A wetlands delineation for the section of Wells Branch that lies between the Millersville Landfill and Gambrills Road was performed by Hogan Environmental Consultants on January 4 and 5, 1994.

Wells Branch is a nontidal stream that emanates at the Millersville Landfill. As the stream leaves the landfill property it then flows through the study area, a distance of about 1,150 feet before flowing under Gambrills Road. The confluence of Wells Branch and Severn Run is approximately 1.1 miles downstream from Gambrills Road. Figure 1 shows the location of the study area.

The purpose of the study is to identify the characteristics of the wetlands associated with Wells Branch in this area. This information will assist in determining the desirability of obtaining a conservation easement, in the form of a forested buffer, to protect the wetlands from potential future activities. The wetland delineation would be also be used as a basis for describing the area around which the buffer would be placed.

2.0 METHODOLOGY

The wetland delineation was performed in accordance with the Corps of Engineers Wetlands Delineation Manual (1987). The manual follows a three parameter approach to making wetland determinations. The manual generally requires that a minimum of one positive wetland indicator from each parameter (hydrology, soil, and vegetation) be found on the site to make a positive wetland determination.

Wetlands are defined in the Federal regulations as "waters of the United States," a broad term that also includes streams, lakes, ponds, and rivers, among others. Intermittent as well as perennial streams are included as jurisdictional "waters." This wetland delineation report describes all "waters of the United States" that exist on the site, both vegetated wetlands and other waters of the United States.

Although procedures for making the wetland determinations in the field are standardized, wetlands are often transition areas between upland habitats and aquatic systems, and judgments are sometimes required as to the location of the wetland/upland boundary. The wetland delineation that was made for this study was based on use of the 1987 manual and our best professional judgment. The wetland boundary is subject to modification by the regulatory agencies. The final wetland determination is the authority of the Corps of Engineers and the Maryland Department of Natural Resources.

For purposes of mapping and describing the wetlands and other jurisdictional waters, the Classification of Wetlands and Deepwater Habitats of the United States (1979) was used. This is a hierarchial system which provides a uniformity of concepts and terms used to define wetlands according to hydrologic, geomorphologic, chemical and biological factors.

2.1 Vegetation

Plant species observed in the wetlands at the site were identified and the wetland indicator status for each species was determined from the National List of Plant Species that Occur in Wetlands: Northeast (Region 1) (May 1988). The indicator status designates the probability of occurrence of a given plant species in wetlands in the northeast region of the United States. The following is a listing of the indicator status designations:

OBL	=	Obligate Wetland (greater than 99% probability of occurrence)
FACW	=	Facultative Wetland (greater than 66% - less than 99% probability of occurrence)
FAC	=	Facultative (33% - 66% probability of occurrence)
FACU	=	Facultative Upland (1% - less than 33% probability of occurrence)
UPL	=	Obligate Upland (less than 1% probability of occurrence)
NA	=	Has been reviewed, but no agreement has been reached by the Regional Interagency Review Panel as to its indicator status

2.2 Soils

A hydric soil is a soil that is saturated, flooded, or ponded long enough during the growing season to develop anaerobic conditions that favor the growth and regeneration of hydrophytic vegetation. A hydric soil may either be drained or undrained, although a drained hydric soil may not continue to support hydrophytic vegetation. According to the manual, only when a hydric soil supports hydrophytic vegetation and the area has indicators of wetland hydrology may the soil be referred to as a "wetland" soil.

During this investigation soil cores were taken using a dutch auger to a depth of about 18 inches. As instructed in the manual, the soils were examined at each sample location to compare their characteristics immediately below the A-horizon or 10 inches (whichever was shallower) with the hydric soil indicators described in Part III of the manual. These characteristics include, in order of decreasing reliability, a.) Organic soils (Histosols), b.) Histic epipedons, c.) Sulfidic material, d.) Aquic or peraquic moisture regime, e.) Reducing soil conditions, f.) Soil color, including gleyed soils and soils with bright mottles and/or low matrix chroma, g.) Soil appearing on the hydric soils list, and h.) Iron and manganese concretions. The "Munsell Soil Color Charts" were used for identification of hydric soil color, chroma, and value.

2.3 Hydrologic Indicators

The Corps of engineers wetland delineation manual states that the term "wetland hydrology" encompasses all hydrologic characteristics of areas that are periodically inundated or have soils saturated to the surface at some time during the growing season. Areas with evident characteristics of wetland hydrology are those where the presence of water has an overriding influence on characteristics of vegetation and soils due to anaerobic and reducing conditions, respectively. Such characteristics are usually present in areas that are inundated or have soils that are saturated for sufficient duration to develop hydric soils and support vegetation typically adapted for life in periodically anaerobic conditions. The manual states that it is essential to establish that a wetland area is periodically inundated or has saturated soils during the growing season.

Indicators of wetland hydrology include drainage patterns, drift lines, sediment deposition, watermarks, stream gauge data and flood predictions, historic records, visual observation of saturated soils, and visual observation of inundation. Any of these indicators may be evidence of wetland hydrologic characteristics.

Indicators of wetland hydrology observed on the site were noted during the field investigation.

3.0 RESULTS

Extensive wetlands exist within the floodplain of Wells Branch between the Millersville Landfill property and Gambrills Road, a distance of about 1,140 feet. The wetlands are classified as palustrine scrub-shrub according to the Cowardin Classification System (1979). Based on the degree of flooding that was evident during the field investigation, a semipermanently flooded water regime was assigned to the wetland.

Three sample plots were examined in the wetland for vegetation, soils, and hydrology. Dominant shrub vegetation within the wetland consists of sweet bay, sweet pepperbush, winterberry, smooth alder, and high bush blueberry. Dominant herbaceous vegetation includes cinnamon fern and carex sedges. Vines include climbing hempweed, greenbrier, and halberd-leaved tearthumb. Trees on the edge of the wetland include black gum, overcup oak, sweet bay, swamp chestnut oak, tulip poplar, sweet gum and red maple. Additional nonpersistent species are likely to be observed during the growing season that were not observed during the field investigation. See Table 1 for list of the wetland plant species observed and their indicator status.

Soils within the wetland are classified by Soil Survey of Anne Arundel County as Bibb silt loam. Bibb silt loam is a poorly drained, silty soil that typically has a dark grayish-brown to light olive-brown silt loam surface layer and dark-gray or gray silt loam underlying material. These soils occur on floodplains among many of the major streams and drainageways in the county. The use of Bibb soils is limited by wetness most of the year and by frequent flooding. These soils are rarely used for farming. Residential use is limited by flooding and poor drainage. Figure 2 is the soil survey map that includes the study area.

The soils encountered within the wetland conform to the description given in the soil survey. The soil immediately beneath the A horizon is typically dark grayish brown (10 YR 4/2) or dark gray (10YR 4/1).

The high degree of water and vegetation interspersion in this wetland system provides a significant water quality benefit for Wells Branch. Except for a few properties to the north of the wetland, a forested buffer presently exists along the slopes adjacent to the wetland. This buffer helps to maintain the integrity of the wetlands and preserve its water quality and wildlife value. Deer scat and grazing was evident in and adjacent to the wetland. Raccoon tracks were also observed, as were numerous song birds that use the wetland for food and cover.

The wetlands have been flagged in the field with pink flagging tape labeled "WETLAND DELINEATION." The flags have been numbered to assist in their location if a field survey is performed. Figure 3 is a map at a scale of one inch equals 200 feet that shows the general location of the wetlands within the study area. This map is intended for illustration purposes only and should not be used for other purposes such as describing a conservation easement.

Figure 3

4.0 RECOMMENDATIONS

It is recommended that a field survey of the wetland flagging be performed only if the precise location of the wetlands needs to be accurately presented. However, if a generalized buffer easement line is described that encompasses the wetlands and steep slopes it may not be necessary to survey the wetland boundary. In such a case the buffer surrounding the wetlands would have a variable width.

The slopes south of Wells Branch are generally steeper than the slopes north of Wells Branch within the study area. The steep slopes south of Wells Branch are generally within a 150-foot distance from the upland/wetland boundary. However, the wetlands vary in width from about 30 feet to about 150 feet. Therefore, a total wetland buffer of 350 to 400 feet would be necessary to capture both the steep slopes and the wetlands. Such a buffer would preclude any development activity along the steep slopes as well as well as provide a water quality buffer to Wells Branch and its adjacent wetlands.

MILLERSVILLE LANDFILL: WETLAND FUNCTION AND VALUE ASSESSMENT

INTRODUCTION

The U.S. Army Corps of Engineers' Wetland Evaluation Technique (WET) was used to perform an assessment of the wetland functions and values of a wetland that may be impacted by proposed construction activities and a wetland replacement site. WET is intended to provide an initial, relatively rapid assessment of wetland functions and values. The results provide a qualitative analysis that may be used to compare the two different wetlands, to provide a baseline for determining effects and changes in the wetlands due to project activities, and to aid in developing design criteria for functional equivalence in created or restored wetlands as part of regulatory mitigation requirements.

The existing wetlands within the project area assessed by WET consist of a palustrine forested wetland (PFO) and several drainage swales associated with an unnamed tributary to Severn Run (Figure 1). These wetlands were identified and their boundaries located in a previous investigation. The mitigation site evaluated is located just to the east of Cell 6 and is shown on the accompanying revised mitigation concept plan (Figure 2). The revised plan incorporates a number of features designed to increase the probability of effectively performing functions similar to those of the existing tributary-associated wetlands. These features include construction of an outlet channel to connect with an existing channel which begins near the eastern boundary of the landfill and flows into Severn Run north of the main onsite tributary. Both the existing and proposed channel in the mitigation site are intermittent in the region of confluence, and discharge from the mitigation site could be controlled at the sediment basin inflow point. The existing channel is sufficiently incised such that overflow of banks is not evident, and the addition of water from the mitigation area should not increase erosion of banks or flooding. The present channel terminates in a several hundred foot wide PFO wetland on the west side of Gambrills Road, which could modulate any increased flooding potential from the mitigation site.

WET ASSESSMENT

The WET method evaluates the functions and values of a wetland by characterizing it in terms of predictors. Predictors are simple or integrated variables that are believed to correlate with the physical, chemical, and biological characteristics of the wetland and its surroundings, e.g., soil, climate, vegetation type, etc. Responses to questions concerning the predictors are analyzed in a series of interpretation keys that reflect the relationship between the predictors and the wetland functions as defined in the technical literature. The interpretation keys assign a qualitative probability rating of HIGH, MODERATE, or LOW to each function in terms of social significance, effectiveness, and opportunity.

Social Significance assesses the value of a wetland to society because of its natural features, economic value, official status, and strategic location.

Effectiveness assesses the capability of a wetland to perform a function due to its physical, chemical, or biological characteristics.

Opportunity assesses the degree to which a wetland has the availability to perform a function to its level of capability.

WET assesses several wetland functions and values, including groundwater discharge and recharge, sediment/toxicant retention, nutrient removal/transformation, sediment stabilization, production export, wildlife and aquatic diversity/abundance, and desynchronization of floodwaters. The value of wetlands as defined by WET refers to their worth, desirability or usefulness to humans or to society. Wetland values assessed by WET include uniqueness/heritage and recreation. The definition of each function and value as described in WET are summarized below.

WET Definitions for Functions and Values

Groundwater Recharge: Recharge wetlands are considered to be those where: (a) recharge to underlying materials or groundwater (deep or shallow) exceeds groundwater discharge to the wet depression on a net annual basis, and/or (b) the rate of recharge typically exceeds the rate of recharge from terrestrial environments.

Groundwater Discharge: Groundwater discharge areas are those where the rate of discharge from groundwater (deep or shallow) into the wetland exceeds the rate of recharge to underlying groundwater from the wetland on a net annual basis.

Floodflow Alteration: Floodflow alteration (desynchronization of floodwaters) occurs in those areas where surface water is stored or its velocity is attenuated to a greater degree than typically occurs in terrestrial environments. No judgment is made as to the value of such flow alteration; in fact, there may be situations in which reduction of flow velocity causes increased flooding due to flow synchronization.

Sediment Stabilization: High sediment stabilization areas are those which are more effective for binding soil and dissipating erosive forces than are typical upland environments.

Sediment/Toxicant Retention: High sediment/toxicant retention areas are those which physically (or chemically in the case of toxicant) trap and retain on a net annual basis the inorganic sediments and/or chemical substances generally toxic to aquatic life.

Nutrient Removal/Transformation: High nutrient removal/transformation areas are those which retain or transform inorganic phosphorus and/or nitrogen into their organic forms, or transform nitrogen into its gaseous form on either a net annual basis or during the growing season, and which are generally more effective at doing so than typical upland environments.

Production Export: High production export is the flushing of relatively large amounts of organic plant material from the wetland into downslope waters.

Aquatic Diversity/Abundance: A high aquatic diversity/abundance rating for an area means that, at least seasonally, the assessment area supports a notably high on-site diversity of fish and/or invertebrates.

Wildlife Diversity/Abundance for Breeding: A high rating for a wetland means that during the breeding season, the wetland normally supports a notably high on-site diversity and/or abundance of wetland-dependent birds.

Wildlife Diversity/Abundance for Migration and Wintering: A high rating for a wetland means that during migration or the winter months, the

wetland normally supports a notably high on-site diversity and/or dependance of wetland-dependent birds.

Prior to answering the questions within the WET program, all available published information was reviewed in the office, and a field visit was conducted to collect data. The published information reviewed included the Anne Arundel County Soil Survey, black and white aerial photographs taken in March 1990, and the National Wetland Inventory Maps. During several field visits data collection generally included observations of physical and biological characteristics of the wetland as well as general information on the surrounding land use, cultural resources, and watershed areas. A wetland report previously prepared by Greenhorne & O'Mara, Inc. was also incorporated into the analysis.

The assessment area (AA), watershed area, and input zone of each wetland were determined from and drawn on the Odenton, Maryland National Wetland Inventory map. Each wetland's site documentation form, evaluation answer sheet, and National Wetland Inventory Map is included at the back of this discussion.

RESULTS

The probability ratings assigned by WET to each function and value of the PFO wetlands on the project site and the mitigation site are summarized in Tables 1 and 2 respectively. It is apparent from these Tables that the existing PFO wetland has different ratings for some functions and values than the mitigation site. The reasons for the differences in the probability ratings between the two areas are described below for each function and value. Note that where an asterisk appears in the summary table it indicates that WET does not evaluate those particular functions and values, and it is not due to lack of site specific data.

Groundwater Recharge - The probability ratings for this function are the same for both wetlands. A low probability for social significance and effectiveness are typical ratings for wetlands in the eastern United States.

Groundwater Discharge - Both wetlands have moderate probability ratings for social significance. The mitigation area has a moderate rating for

effectiveness but the wetland is only low for this function. The low rating is primarily due to the lack of permanent inundation, whereas the mitigation site could receive hydrology from the sediment basin in somewhat drier conditions.

Floodflow Alteration - The social significance rating is low and opportunity is moderate for both wetlands. WET assigns a high rating for effectiveness to both wetlands, since there is intermittent flow through their outlets. The moderate rating for opportunity is due primarily to the size of the wetlands in relation to their watersheds.

Sediment Stabilization - A low rating was assigned to both wetlands for social significance, but both received a high rating for effectiveness. The high value is primarily due to the predominance of a forested vegetation class wider than 20 feet.

Sediment/Toxicant Retention - Both wetlands received a moderate rating for social significance. The existing wetland received a low rating for effectiveness; whereas, the mitigation area was rated moderate. In addition, both areas were rated high for opportunity. The difference between the moderate and low rating for effectiveness is due primarily to the mitigation area possessing more than one wetland zone and that the zones are vegetated. The existing wetland lacks shallow seasonal or permanent inundation and diverse vegetative cover. The high rating assigned for opportunity is because both areas can receive some sediment and toxicants from the existing landfill.

Nutrient Removal/Transformation - A moderate rating was assigned to both wetlands for social significance. The mitigation area was rated high for both effectiveness and opportunity, whereas, the existing wetland rated high for opportunity but low for effectiveness. The difference in the ratings is because the mitigation area was rated higher for sediment retention (the program assumes that if the wetland is conducive to sediment trapping it is often, but not always, also conducive to nutrient retention), and that is possesses significant and diverse vegetation and a portion with a permanently or semi-permanently flooded water regime. The existing wetland does not possess these characteristics. Furthermore, the high rating for opportunity is due to the potential non-point source of nutrients from the landfill.

Production Export - Both wetlands were rated moderate for the effectiveness of this function due to more than minimal extent of erect vegetation, potential for high levels of dissolved solids and presence of an outlet.

Wildlife Diversity/Abundance (D/A) - Both areas were rated low for social significance. Although both areas are located in a waterfowl use region of major concern (as shown in Figure 5 of the WET methodology manual) neither wetland has one acre or more of open water.

Wildlife D/A - Breeding - The existing wetland was rated low for effectiveness and the mitigation area rated high. There are many conditions that result in a high rating for this function. A few are: high vegetation interspersion and class diversity and some open water. However, the small size of the mitigation area would seem to reduce its effectiveness for this function.

Wildlife D/A - Migration - The PFO wetland was rated low for this function and the mitigation area was rated high. The latter area has a higher potential for diversity of wildlife during migration primarily because of the high vegetational interspersion. The small amount of acreage would likely limit the actual use by wildlife to small numbers.

Wildlife D/A -Wintering - A low rating was assigned to the existing wetland area and a high rating to the wetland. The differences between the ratings are due to the same characteristics as cited above for migration and breeding.

Aquatic Diversity/Abundance - Both wetlands were rated low for this function. Reasons for this low rating include lack of access.

Recreation and Uniqueness/Heritage - No interpretation keys are presented for assessing opportunity and effectiveness of these values because no scientific basis exists for an objective assessment without considerable site-specific data collection. However, the mitigation area has a higher social significance because monitoring can provide useful data on successful establishment of wetlands.

In summary, the proposed wetland mitigation site, if implemented as shown in the accompanying plan, should replace the functions expected to be lost due to the landfill expansion. A number of functions and values would probably be performed more effectively than the existing wetland.

MITIGATION SITE SUITABILITY

The proposed mitigation site was evaluated as to its potential to support wetlands on an annual basis. The long-term success of this project, like any wetlands creation project, is primarily dependent upon maintaining appropriate hydrology. A water budget was developed for the site to assess the balance between inflows and outflows during the growing season.

Groundwater studies for the Phase III permit modification show a perched water table in the vicinity of the mitigation site. A confining layer of clay exists approximately five feet below the surface. Evidence of this perched condition can be found within the site where patches of saturated soils support hydrophytic vegetation such as cattails. The excavation proposed would likely increase the area where groundwater would be available. Clay is available in nearby locations, and a clay liner would be installed to reduce percolation where necessary.

Despite the potential for groundwater as a hydrology source, a water balance excluding groundwater was developed, since runoff is often the most important source of water for natural as well as created wetlands.[1] Attempts to construct wetlands that rely primarily on groundwaters have not generally been successful to date due to limited knowledge of groundwater fluctuations and movements. The water budget for this site was based on the following inflows and outflows:

1. Runoff input from a 57.5 acre drainage area;
2. Direct precipitation input to the 3.8 acre wetland; and
3. Evapotranspiration output from the wetland.

Assuming that all precipitation will be runoff except for an initial abstraction of 0.2 inches, and that the average summer month has seven storms of 0.5 inches, the monthly runoff volume will be about 10 acre-feet. The high runoff value is based on the relative impermeability of the landfill cells which will eventually be capped. The monthly direct precipitation is 1.1 acre-feet. An evapotranspiration rate of 0.34 inches per day for the mitigation site is expected, and would result in a loss of

---

[1]Hammer, Donald. 1992. Creating Freshwater Wetlands. Lewis Publishers, Inc., Chelsea, MI, 298p.

3.2 acre-feet. Thus, the net input to the site, excluding groundwater, would be 7.9 acre-feet per month.

The water available for the mitigation site is expected to be adequate from surface and potential groundwater sources. During extreme dry periods water may be discharged from the sediment basin on a temporary basis. Excess water would be discharged from the mitigation site via the channel proposed to connect with the existing off-site channel. Thus, a connection with an existing tributary to Severn run would be maintained. Presently, runoff sheetflows with occasional erosive force across the landfill property and enters the existing intermittent channel at its headwaters. The proposed channel would minimize this sheetflow scouring and add riparian values.

APPENDIX

ALTERNATIVES EVALUATION

I. INTRODUCTION

Anne Arundel County, Maryland, currently operates two sanitary landfills: Millersville Sanitary Landfill and Sudley Road Sanitary Landfill. The Millersville Landfill serves the northern portion of the County, and the Sudley Road Landfill serves the southern portion. Spurred by recent developments in landfill technology, special conditions in the landfills' respective operating permits, and the passage of specific environmental regulations governing solid waste disposal in Maryland, Anne Arundel County has undertaken to redesign both landfills. Redesign will allow continued operation and service to the people of Anne Arundel County.

Millersville Landfill currently operates under the State of Maryland Refuse Disposal Permit Number 86-02-04-06A. As part of the effort to redesign this landfill, a Phase III Permit Modification Application has been submitted in partial fulfillment of the municipal solid waste requirements of the code of Maryland Title 26 - Department of the Environment, Subtitle 4 - Regulation of Water Supply, Sewage Disposal, and Solid Waste Chapter 7 - Solid Waste Management, (COMAR 26.04.07) The redesign of the landfill consists of installing cell liners and a drainage system within and around the proposed cells to prevent leachate from contaminating groundwater aquifers and consequently, public drinking water.

The refuse disposal permit allows the construction of 10 landfill cells. Cells 1 through 7 already exist, and construction of cells 8 and 9 is planned for the immediate future (cell 10 was combined with cell 9).

An application for a U.S. Army Corps of Engineers permit to channelize a segment of a stream channel necessary for the construction of cells 8 and 9 was submitted in March of 1990. During review of this application by the U.S. Army Corps of Engineers, it was determined that additional wetlands exist on the site. Consequently, a wetlands investigation was performed and the permit application was resubmitted in February of 1991.

This report describes and evaluates the proposed action to redesign cells 8 and 9 and several alternative options. It is intended to incorporate comments from the joint evaluation meeting and to provide supplemental information for the regulatory agencies during their evaluations of the U.S. Army Corps of Engineers permit application.

II. PURPOSE AND NEED FOR THE PROJECT

The Millersville Landfill serves much of the northern half of Anne Arundel County, accepting solid waste from County contract and commercial haulers, as well as private citizens. The Anne Arundel County population in the northern section alone (excluding the Annapolis area) is expected to reach 393,597 people by the year 2010. This represents an increase of 47,428 over the 1990 population figures of 346,169. More importantly, the

quantity of solid waste refuse generated within the County is projected to increase from 354,835 tons per year in 1991 to 433,669 tons per year (including recycling) in 2017. A more complete discussion and substantiation of these projections is found in Section V.A.2. The purpose of constructing and modifying cells 8 and 9 of the landfill is to provide more environmentally sound waste disposal practices and to accommodate the increasing solid waste disposal needs of northern Anne Arundel County for the next 25 years. Increased development and population growth projected for northern Anne Arundel County will place increased demands on solid waste disposal facilities. Recent environmental regulations require more efficient and environmentally sound disposal practices; therefore, the modified design exceeds MDE requirements and complies with Federal Regulations contained in the proposed EPA Subtitle D.

III. DESCRIPTION OF THE PROPOSED ACTION

A. Site Location and Description

The Millersville Landfill site is located about one mile due east of Fort George G. Meade and approximately one mile northwest of Millersville in northern Anne Arundel County, Maryland (see Figure 1). The site is located in the Odenton Quadrangle of the United States Geological Survey (USGS) 7.5 minute map at a latitude of approximately N39°5'30" and a longitude of approximately E76°40'00". An intermittent stream traverses the site, generally from west to east, becoming perennial at the eastern site boundary. The stream continues to the east until it meets Severn Run, which, in turn, eventually flows into the Severn River.

The site is divided into two sections by a 120-foot wide Baltimore Gas and Electric right-of-way trending generally west to east in the northern third of the site. The northern third of the site has been developed, and prior landfilling activities there are completed. The remaining southern portion of the site is the location of current landfilling activities. A large portion of the southern part of the site is undeveloped and densely wooded or covered with heavy brush.

Elevations at the site range from a low of about 100 feet above sea level at the center of the site along the intermittent stream banks, to a high of about 240 feet above sea level at the southern and western site boundaries.

B. Site History and Redesign Plan

Anne Arundel County began operations at the Millersville Landfill in January of 1975. The initial site development plan was prepared in 1974 and included 10 separate landfill cells numbered sequentially from cell 1 to cell 10. Cells 1 through 4 are located in the northern portion of the site (north of the Baltimore Gas and Electric right-of-way), cells 5 through 8 are located in the center of the site, and cells 9 and 10 are located in the southern portion of the site (see Figure 2).

Waste disposal at the Millersville Landfill has generally proceeded along guidelines and operating procedures described in the Millersville

MILLERSVILLE
SANITARY LANDFILL
PLAN VIEW

Intermittent Stream

Perennial Stream

Stream Diversion

Figure 2

Landfill operational plan, prepared in 1976. Cells 1 through 4 have been completed as designed. Cells 5 through 7 also have been filled. However, until approvals and permits are obtained to begin construction of cell 8, filling has continued in the areas between cells 5 through 7 to accommodate the continuous influx of refuse and minimize the area of waste disposal on unlined earth. As a result, there will be an attendant increase in height of the final landfill mound.

The Phase III Permit Modification Application addresses the redesign of previously permitted cells 8, 9, and 10 at the Millersville Landfill site. The redesign includes the following changes:

- Cell 8, a 57-acre landfill cell, will be double-lined with provisions for leachate collection above the top liner and leakage detection between the top and bottom liners;
- Cells 9 and 10 from the existing refuse disposal permit will be incorporated into a single cell, now referred to as cell 9;
- Cell 9 (newly designated) will be an 84-acre double-lined landfill cell with provisions for leachate collection above the top liner and leakage detection between the top and bottom liners; and
- the new cells will have basically the same footprints as those in the existing permit, but the final cover slopes and the final heights are different from those originally designed.
- trash from cells 2, 3 and 4 will be excavated and relocated to cells 5, 6 and 7 because of leachate problems in the former cells. The plan for cells 5, 6 and 7 are shown in Figure 3. Cells 2-4 will then be converted to a yard waste and composting site as shown in Figure 4. No wetlands would be impacted by these activities.

As indicated, each cell will have a double-liner system with a leachate collection system located above the top liner and a leakage detection system located above the bottom liner. This modification is in compliance with special conditions number I.B.1.a of the existing refuse disposal permit and exceeds the requirements of COMAR 26.04.07.07.C(12)(a). The new cells also will incorporate engineered final cover systems to minimize leachate generation after cell closure.

1. <u>Existing and Proposed Structures</u>

Existing structures at the Millersville Landfill include:

- access roads to existing cells;
- an administration building;
- a maintenance building;

- two materials recycling buildings;
- a scale house and scale; and
- a perimeter fence.

New structures planned for the Millersville Landfill not previously mentioned in the redesign plan include:

- 14,000 feet (4,300 m) of new access roads;
- nineteen leachate riser houses (10 ft by 18 ft or 3.0 m by 5.5 m)
- two leachate wet-well pump stations;
- 8,580 feet (2,620 m) of leachate collection gravity header pipe;
- 5,160 feet (1,570 m) of leachate forcemain pipe;
- a 0.5-acre (0.2-hectare) leachate storage and containment area;
- two 250,000-gal (950,000-liter) leachate storage tanks;
- leachate pre-treatment plant; and
- leachate truck-loading facilities.

2. Waste Types

In accordance with COMAR 26.04.07.08.B(4), a description of the types of solid waste that will be accepted at the Millersville Landfill and the types of solid waste that may not be accepted are described below.

Waste Accepted

The Millersville Landfill is designed to accept nonhazardous municipal, commercial, construction, and some industrial solid waste. Solid waste disposed of at Millersville Landfill is brought from domestic and commercial sources and municipal operations. Industrial wastes are not expected, but small quantities may be brought to the site by commercial haulers. Generally, wastes disposed of at the Millersville site are a heterogenous mixture of paper products, plastics, cars, food waste, glass, rubber and leather products, textiles, metals, and yard waste.

Waste Not Accepted

The Millersville Landfill will not accept hazardous waste. In conjunction with current operations, the following wastes are also not accepted: petroleum products, acids, caustics, explosives, chemical wastes, anti-freeze, paint, bulk detergents, dead animals, sewage solids or liquids, septic tank pumpings, and sewerage sludge.

IV. ALTERNATIVES CONSIDERED

The No-Build Alternative and five Build Alternatives including two complete wetland avoidance schemes, were studied for the proposed modification and construction of cells 8 and 9 of the Millersville Landfill. The five Build Alternatives have the same number of sub-cells and the same leakage detection and leachate collection removal systems.

The proposed activity consists of modifying and constructing an already existing, active and permitted landfill. The proposed activity does not require locating a new landfill site. For this reason, this evaluation does not address alternative landfill sites within the county. A complete discussion on landfill site evaluations in Anne Arundel County can be found in the Final Site Evaluation Report, (1972).

A. Alternative I - No-Build

This alternative does not implement any modifications to the design of cells 8 and 9, such as cell liners and leachate collection and removal systems. Consequently, as a result of recent environmental regulations, construction of cells 8 and 9 would be prohibited and no additional cells would be provided.

B. Alternative 2

Alternative 2 would completely avoid wetland impacts by locating cell 8 to the northwest and cell 9 to the southeast of the main channel to the Severn Run tributary and all subtributaries. The size and shape of the cells would remain the same as in Alternative 4.

C. Alternative 3

Alternative 3 would accomplish total wetland avoidance by reducing the size of cells 8 and 9 relative to Alternative 4, as well as modifying their configuration (see Figure 5).

D. Alternative 4

Alternative 4 consists of locating cells 8 and 9 as shown in the U.S. Army Corps of Engineers wetland permit application dated February, 1991 (Figure 6). The size, shape, and location of the cells are the same as those shown in the original footprint for cells 8, 9, and 10 already approved under Refuse Disposal Permit Number 86-02-04-06A. A berm would be constructed around the perimeter of each cell to accommodate the leachate collection and removal system.

E. Alternative 5

In Alternative 5 the configuration and size of Cell 9 is modified relative to alternative 4 in order to minimize wetland impacts. Cell 8 maintains the size and shape of Alternative 4 (see Figure 7).

V. EXISTING ENVIRONMENTAL CONDITIONS

A. Socioeconomic

The lack of general acceptance by the public of sanitary landfills is probably caused by the many nuisances perceived to be associated with landfill operations. Some of these nuisances include roadside litter, offensive odors, aesthetic impact, dust and smoke, traffic and noise, and disease vectors (rodents, insects, birds, etc.). In reality, these nuisances are virtually absent from a properly operated landfill.

1. Service Area and Population Projections

Millersville Landfill serves much of the northern half of Anne Arundel County, accepting solid waste from County contract and commercial haulers as well as private citizens. The County is divided into two areas designated North County and South County. Millersville Landfill generally serves the North County, which includes Assessment Districts 3, 4, 5, and 80 percent of District 2. The Millersville Landfill service area is shown in Figure 9.

The Millersville Landfill will start accepting municipal solid waste (MSW) from South County in the year 2011. This increase in the waste stream is predicated on the projected closure of the Sudley Road Sanitary Landfill at that time.

Currently, the population within the Millersville Landfill service area approaches 350,000 people, and is expected to exceed 390,000 people during the design life of the project. Population projections for the Millersville Landfill service area are shown in Table 1.

Millersville Sanitary Landfill Service Area

2. Anticipated Solid Waste Quantities and Facility Life Projections

The Anne Arundel County Department of Public Works Bureau of Solid Waste has estimated existing and future quantities of waste expected to be received at the Millersville Landfill. These estimates have been submitted in annual reports to Maryland Department of the Environment. It is assumed that the waste stream quantities projected represent all of the eligible waste generated in the Millersville service area. The Anne Arundel County Draft Recycling Plan (GBB, 1989) estimated the quantity of recyclable material salvaged from the landfilled waste. This quantity is subtracted from the potential waste stream to give an actual quantity of solid waste to be landfilled. The projected annual solid waste quantities generated, recycled, and landfilled for the Millersville service area is provided in Table 2. The County estimates that recycling will gradually increase over the next four years until a maximum of 20 percent is achieved in 1995. It is unlikely that more than 20 percent per year would be recycled under present social and technological conditions. Thus, while the rate of landfillable solid waste will moderate over the next four years, the long-term projections indicate an accelerated rate despite recycling due to population increases in the County and expected industrial and commercial growth.

The Millersville Sanitary Landfill is projected to have a useful(design) life of approximately 25 years. The yearly projections are shown in Table 3.

B. Natural Environment

1. Wetlands and Waterways

Wetland determinations were made in accordance with the Federal Manual for Identifying and Delineating Jurisdictional Wetlands (1989). This manual generally follows a three-parameter approach to making wetland determinations: hydrophytic vegetation, hydric soils, and hydrologic indicators. All three parameters normally must be present for an area to be considered a wetland under Section 404 of the Clean Water Act. Exceptions to the requirements that all three parameters be present include open-water and riverine systems and disturbed areas.

Wetlands within the study area are associated with an unnamed tributary to Severn Run. Several drainage swales that flow into the unnamed tributary were also identified and delineated. Severn Run and all its tributaries are classified as Class IV surface waters according to COMAR 10.50.01.02I. Class IV designates Severn Run and its tributaries as recreational trout waters.

Wetland acreages were determined by planimetering wetland areas from 200-scale site development plans. Based on these computations, there are approximately 19 acres of palustrine, forested and riverine wetlands on the project site.

2 [illegible] waste to cover material ratio 4.2:1

3 [illegible]ne of solid waste plus cover material

The surveyed wetland boundaries were drafted onto 200-scale site development plans and are included in the appendix.

2. Site Geology and Hydrogeology

A site subsurface investigation was conducted in the early 1970s when Anne Arundel County purchased the Edgewood Farm Country Club for the purpose of constructing the Millersville Landfill. Twenty-five test holes were drilled as part of a routine subsurface investigation and observation wells were installed and screened in various subsurface water bearing zones.

Surface geologic mapping in the vicinity of the Millersville Landfill site indicates the predominance of the silt-clay facies of the Potomac Group in the northeastern part of the site and the sand-gravel facies of the Potomac Group in the central portion of the site. The Magothy Formation, a predominately sandy unit, outcrops along the southern boundary of the site just north of Dicus Mill Road. Ferruginous cementation is common in the fluvial facies of the Magothy Formation. Blocks of ironstone conglomerate outcrop in this area.

Groundwater studies by Mack (1962) and Mack and Achmad (1986) suggest that the silt-clay facies of the Potomac Group at Millersville Landfill is part of a clay confining layer separating the overlying Magothy Formation from the underlying upper Patapsco Formation. The discontinuous silt-clay facies (upper confining layer) at Millersville occurs at the ground surface under cells 1, 6, 7, and part of cell 5, and at or near the ground surface under cell 4. The sand-gravel facies of the Potomac Group occurs at the center of the landfill, roughly paralleling the existing surface drainage; this facies probably represents an old stream channel. The southern half of the site is capped by the sands of the Magothy Formation. Sand lenses occur within the clay facies (i.e., within the upper confining layer) underlying the entire site.

From all of the available information reviewed for the preparation of this evaluation, it appears that four water-bearing zones occur in the upper 300 feet (90 m) beneath Millersville Landfill to a depth of approximately 135 feet (40.5 m) below sea level. The uppermost zone is in the fluvial sands of the Magothy Formation. Groundwater in this zone is unconfined and perched. This water-bearing zone is restricted to the southern and southwestern boundaries of the site, north of Dicus Mill Road, and along Burns Crossing Road, respectively. During all or part of the year, this zone may be dry in some areas.

The second water-bearing zone occurs in a shallow sand zone within the silt-clay facies described by Glaser (1976). (Notes: The silt-clay facies described by Glaser is the same as the confining layer described by Mack and Achmad (1986) that separates the overlying Magothy Formation from the underlying upper Patapsco. The shallow sand zone in the silt-clay facies has also been described by Pittman (1982). In the southern part of the site, this sand zone may be either unconfined or confined, and is recharged directly from precipitation or leakage from the overlying perched aquifer.

The third water-bearing zone is the deep sand zone described by Pittman (1982). This sand zone is located approximately 25 feet (7.5 m) below the shallow zone in the southern half of the site, and below the outcropping silt-clay facies in the northern half of the site. Groundwater in this zone is either semi-confined or confined. The hydrostatic heads in the water-bearing zone are lower than the perched or shallow zones indicating the potential for recharge by leakage from the overlying zones.

The fourth water-bearing zone is the upper Patapsco aquifer, which is the major ground water aquifer in the vicinity of the Millersville Landfill. The upper Patapsco aquifer is confined by clays of the upper confining layer (Mack and Achmad, 1986) the silt-clay facies described by Glaser, (1976) separating the Magothy Formation from the upper Patapsco sands.

As required under COMAR 26.04-07.07.C(4), the maximum groundwater elevations have been predicted for Millersville Landfill. These groundwater elevations will be used to design landfill cells 8 and 9 so that they meet the 3-foot (1 m) minimum groundwater separation requirements of COMAR 26.04.07.07.C(12)(b).

3. Groundwater Quality

In order to monitor groundwater quality at the Millersville Landfill, wells were installed in 1975 and groundwater samples have been collected and analyzed on a regular basis since landfilling began.

Groundwater samples from wells at Millersville Landfill have been collected generally two or three times per year since 1975. Samples were collected and analyzed by the Maryland Department of the Environment (MDE) for the parameters listed below. In order to characterize water quality at the landfill, GeoSyntec evaluated generally accepted key indicator parameters from the results of MDE's analytical program. Key indicator parameters used by GeoSyntec are pH, nitrate, chloride, specific conductance, alkalinity, hardness, arsenic, barium, cadmium, chromium, lead, mercury, selenium, chemical oxygen demand (COD), and volatile organics. An evaluation of these parameters meets the requirements of COMAR 26.04.07.07.C(8)..

4. Soils

The Millersville Landfill lies within the physiographic province known as the Atlantic Coastal Plain. Specifically, the landfill is located in the uplands of the Coastal Plain. Soils on the Millersville Landfill site are a part of the Evesboro-Rumford-Sassafras Association. This association is characterized by a gently sloping to moderately steep topography with well-drained, sandy and loamy soils that developed in sediments containing glauconite.

Soils in the wetland areas on the landfill site consist of Rumford sandy loam and Woodstown sandy loam.

The Rumford series consist of deep, somewhat excessively drained soils that formed in sandy material containing some clay but little silt. The surface layer generally contains a considerable amount of medium and coarse sand. The Rumford series is not listed on the National Hydric Soils List.

The Woodstown Series consist of deep, moderately well-drained soils with a sandy or silty material in the surface layer and a subsoil of sandy clay loam with some gray mottles in the lower part. Surface water drains away readily. The Woodstown sandy loam is not listed on the National Hydric Soils List. However, this series may have hydric inclusions of Fallsington in depressions and along drainageways.

EVALUATION OF ALTERNATIVES

If the No-Build Alternative is selected, the existing active cells of the landfill will be filled within 2 years. After that time, no public facility to dispose of the solid waste generated by the people of northern Anne Arundel County will be available. Upon closure of the existing landfill cells, the No-Build Alternative would result in no fill discharge to the existing wetlands on the site. Potential public nuisances such as roadside litter, odors, dust and smoke, traffic and noise sometimes associated with a landfill operation will be diminished. Several health and environmental parameters would, however, be adversely affected by the No-Build Alternative. With a projected increase in the tonnage of solid waste generated as a result of the increased population growth and no proper disposal sites, an undue economic and environmental burden on the people and government of Anne Arundel County would occur. The No-Build Alternative is not compatible with the future public needs of Anne Arundel County.

Alternative 2 consists of relocating cells 8 and 9 away from the wetlands associated with the main stream channel while maintaining the proposed cell volume and shape. The location of cell 8 is controlled to the northwest by the Baltimore Gas and Electric Company right-of-way, to the northeast by the existing cell 5 and to the west by the existing landfill access road.

Two subalternatives were considered. Subalternative 2A involves constructing Cell 8 into the BG&E right-of-way and under the power lines. Several towers would need to be relocated and their height increased to allow fill to be placed underneath the transmission line. As Federal Aviation Administration (FAA) regulations limit the height of the towers, 150 feet is the maximum tower height recommended at this location. After allowing for safety clearance of 30 feet from the lowest point of sag for the bottom wire, only 30 feet of airspace remains for landfilling activity. This decreases the economic advantage of constructing a liner in this area since the full capacity of the cell could not be achieved.

BG&E has been contacted regarding this proposal, and they decided to rule out this plan in a letter dated July 3, 1991. Reasons stated include the fact that this would limit access to their facilities and preclude them from potentially laying underground gas lines in this right-of-way in the future.

Subalternative 2B involves relocating the Baltimore Gas & Electric company's (BG&E) existing overhead transmission lines and Right-of-Way (ROW) to the northern edge of the landfill property allowing proposed Cell 8 to be shifted north away from the impacted wetlands.

In order to accomplish this ROW relocation, the Public Service Commission (PSC) must grant its approval. This approval process requires an application be prepared by BG&E to be reviewed by the PSC. Also, BG&E must obtain "tree rights" from all abutting property owners to allow BG&E the ability to trim all trees which might potentially impact the safe and continuous operation of the power lines. If there were no opposition and all parties moved expeditiously through this process, it is estimated that at least 12 months would be required to obtain final PSC approval.

If opposition is encountered, as it usually is, the PSC would require an environmental assessment and public hearing of the proposed activity. Generally, opposition is encountered from adjacent and impacted property owners who do not desire the ROW be located on or near their property. Such property owners can refuse to grant "tree rights". They can object to the visual impacts of the overhead transmission lines. And, they may object on grounds that such proximity to these size lines subjects themselves to electro-magnetic force (EMF) radiation.

This type of opposition has caused the PSC to require environmental assessments and full public hearings of proposed projects. The estimated time frame to pursue this course is over 2 years. The end result is either the opposition rescinds, or the PSC grants approval which may even include allowing the utility to take, by condemnation, property for a project.

Relocating this ROW would involve moving the 230 kV, double circuit overhead power transmission lines. Eight towers would have to be moved and/or replaced at an estimated cost of nearly $2 million. In addition, each of the following would require about one year to complete: PSC permission, zoning and building permit, and construction. During these time delays the existing capacity of the landfill will be reached before the planned expansion could be completed. The same consequences might be realized as discussed in Alternative 1 - No Build.

Similarly, the relocation of cell 9 is restricted due to the existing recycling and storage facilities to the west, the site property boundary to the east and the required 500-foot buffer to Dicus Mill Road to the south. Zoning regulations for Anne Arundel County allow sanitary landfills as a special exception. Anne Arundel County zoning regulations Title 12-242 permit a sanitary landfill provided certain specific criteria are met, such as: the landfill must be operated by the County, the minimum land area is 100 acres; the facility is surrounded by 6 ft. high fencing; only waste

generated in the County be accepted; and that the facility meet the requirements of the County Health Ordinances as contained in Article 14, Title 4 of the County Code.

The County Health Ordinances under Title 4 address sanitary landfills:

1. Section 4-108(b) requires all landfills, regardless of type of refuse to be deposited, to be at least 1000 feet from any residential institutional, or industrial building;

2. Section 4-108(c) prohibits landfill encroachment into a natural 50-year floodplain and any landfill activity that would hinder the natural drainage pattern of the "general vicinity" of the site; and

3. Section 4-106 prohibits deposit of refuse within 500 feet of a public roadway, building, or neighborhood dwelling.

Only the County Zoning Ordinances allow for variances. The zoning ordinances contain no specific setback requirements for a sanitary landfill but the health ordinances specifically call for 500 feet from a public roadway. Further, if a variance were sought, it would need to be demonstrated that reducing the buffer would not be detrimental to the public welfare. In reality, reducing the buffer is potentially detrimental to the public welfare. As the landfilling activity occurs closer to the public road and neighborhood dwellings, the impacts from noise, dust, odor, and vectors is increased. Also, the visual impacts and potential groundwater impacts are greater as the landfilling activity is brought closer to the public domain.

It is highly unlikely that the public would allow such a variance. In fact, last year the City of Annapolis attempted to expand their existing landfill by rezoning an adjacent parcel of property. The measure was defeated as a direct result of public opposition which focused on visual impacts and potential groundwater contamination.

Therefore, the possibility of obtaining a variance to reduce the 500 foot buffer along Dicus Mill Road is considered untenable and not an acceptable option. Both Alternatives 2A and 2B are not considered acceptable options.

Alternative 3 would achieve total wetland impact avoidance by altering the size and shape of Cells 8 and 9 relative to that of Alternative 4. While wetland impacts would be avoided, this alternative would not achieve the objectives of the project. Rather than a useful life approaching 25 years, Cell 8 would achieve capacity in 8 years and Cell 9 in 6.9 (see Table 4). In addition, the social, political and economic problems of locating, gaining approval and purchasing additional sites within that short of a period make this option untenable. Making improvements and expanding the existing site with today's valued dollars would be much more economically feasible than using inflated dollars to purchase scarce sites in the future.

Alternative 4 would construct the cells in the same location as the .ootprints shown in the approved permit and include the modifications required by the Maryland Department of the Environment Office of Solid Waste. Cell life for Cell 8 is projected to be 10.2 years and is 16 years for Cell 9. This alternative would impact approximately 7.8 acres of nontidal wetlands and requires channelizing 340 feet of stream channel. This alternative is not expected to have a detrimental effect upon water quality. Erosion and sedimentation will be controlled during the project construction through the use of appropriate erosion and sediment control practices. Cells 8 and 9 will have 5 feet of a protective liner system and state-of-the-art leachate collection and removal systems. All leachate will be transported to a treatment facility prior to its discharge back into the environment. In addition, groundwater monitoring wells are already in place and routinely monitor the quality of the groundwater in order to detect any leakage or potential contamination to the groundwater. If leakage is detected, measures to rectify the problem will be completed prior to the leakage getting offsite. The daily covering of the refuse with soil would minimize spreading of litter, and presence of odors and disease vectors.

Alternative 4 provides the maximum public benefit available. With the projected population growth in Anne Arundel County and the planned closing of the Sudley Road Landfill, it is necessary for the Millersville Landfill to meet the solid waste disposal needs of Anne Arundel County. Alternative 4 accomplishes these needs.

Alternative 5 contains the same size and shape for Cell 8 as in Alternative 4, but in an effort to reduce wetland impacts the size and shape of Cell 9 would be modified. Sediment basin 9-1 would be relocated and the impacts due to the access road between Cells 8 and 9 would be reduced. Total wetland impacts would be approximately 3.9 acres, but cell life would be 13.4 years for Cell 9 and only 10.2 years for Cell 8.

TABL

ALTERNATIVES ANALYSIS

Alternative	Cell	Wetland Impact	Available Waste Volume[1] (million cu yd)	Cell Life Projection[2] (yrs)	Total Cell Life Projection
1	8&9	0	1.2	2	2
2A + 2B	8&9	0	*	*	*
3	8 9	0	5.0 4.3	8 6.9	14.9
4	8 9	7.8	6.4 10.1	10.2 16	26.2
5	8 9	3.9	6.4 8.4	10.2 13.4	23.6
6	8 9	3.7	6.4 10.1	10.2 16	26.2

Notes: [1]Available waste volume is computed as total airspace volume less the volume of liner cover soil, final soil cover over the waste, and protective cover soil over the cap (i.e., 6 ft x cell area).

[2]Cell life projection is based on an assumed in-place density of the waste of 0.7 ton/cu yd and a daily weight of waste of 1,200 tons.

*Alternative not practicable.

Alternative 6 retains the configuration and size of Cells 8 and 9 relative to Alternative 4, and incorporates the sediment basin relocation and road crossing improvements of Alternative 5. It utilizes reinforced soil walls in order to achieve a reduction of wetland impacts to 3.7 acres, the lowest of the practicable alternatives. Cell life remains at 16 years for Cell 9 and 10.2 years for Cell 8, as in Alternative 4. Public benefits are maximized as in Alternative 4 also.

As illustrated in Figure 10, the use of vertical reinforced soil walls (or possibly steep reinforced embankments) at the outside edge of the cell perimeter access roads, instead of the unreinforced berms originally proposed, results in significant minimization of the impact of new construction on wetlands at the Millersville Landfill site.

The basic concept behind soil reinforcement is the use of tension-carrying reinforcing members to improve the mechanical properties of a soil mass. Reinforcements, through adherence to the surrounding soil, enable development of a coherent material that has the capacity to both stand unsupported and to resist externally applied loading. Reinforced soil walls are widely used as earth retaining structures and as highway bridge abutments.

Various types of reinforced soil walls are shown in Figure 11. Reinforced soil walls are made of three components: (i) backfill material, (ii) reinforcements, and (iii) facing. The backfill material commonly used for reinforced soil walls is granular soil (i.e., sand). Other types of soils can also be used. The following is a partial list of reinforcement materials currently available:

- steel strips;
- steel bar mats;
- welded wire mesh;
- geotextiles; and
- geogrids

The facing of reinforced soil walls is not structural, i.e. it is not a critical factor for the overall stability of the structure. Its primary function is to prevent the loss of backfill material between reinforcements at the face of the structure. For this reason, a large number of facing systems have been used, including custom facing elements designed for specific projects to match environmental requirements and to blend aesthetically into the environment. The most commonly used facing systems are:

- segmental precast concrete panels;
- cast-in-place concrete, shotcrete, or full height precast panels;
- masonry blocks;
- concrete blocks;
- timber;
- gabions; and

NOTE: THIS FIGURE IS TAKEN FROM NCHRP REPORT 290, "REINFORCEMENT OF EARTH SLOPES AND EMBANKMENTS"

Figure 11

- wrap-around reinforcement (i.e., the reinforcement is wrapped around to form the face of the wall; typically available for welded wire mesh, geotextile, and geogrid reinforced soil walls

From a construction point of view, reinforced soil walls are well-suited for the application considered for this project: the construction of reinforced soil structures is rapid, simple, and requires neither large and special equipment, nor specially skilled craftsmen. More importantly for this application, little space is needed in front of the wall for construction, as the walls can be built almost entirely from the backfill side. Reinforced soil walls generally cost less than conventional retaining walls (e.g., reinforced concrete walls), and are flexible structures that can tolerate both internal and external ground movements.

VII. CONCLUSIONS

Seven alternatives (including two subalternatives) for the construction and modification of cells 8 and 9 of the Millersville Landfill were considered.

The No-Build Alternative (Alternative 1), is not considered feasible because it provides no public benefit and would require locating a new landfill site within the county in less than two years. Public opposition to a new landfill site is anticipated to be considerable; therefore, this alternative is not considered to be practical.

Alternative 2A is not practicable because BG&E has rejected the concept of permitting landfill activities within their right-of-way.

Similarly, Alternative 2B requires significant coordination and permission from BG&E as well as the PSC, zoning and building permits. These issues plus construction delays of at least one year and an additional $2 million in costs make this alternative not practicable. Also, the ability to obtain a variance and reduce the 500 foot buffer along Dicus Mill Road is considered untenable and not an option.

Alternative 3, decreasing the overall size of cells 8 and 9, would decrease impacts to wetlands along the main channel. However, this alternative would reduce the cell volume and air space, thereby substantially reducing the total cell 8 and 9 life expectancy to less than 15 years. A decrease in the life expectancy of the facility would necessitate finding a new facility within the county at an earlier date. This action would increase the environmental risk to other locations within the county and would likely result in strong public opposition.

Alternative 4 has already been approved under permit 86-02-04-06A. This alternative provides maximum public benefits, reduces the potential for adverse environmental impacts, represents state-of-the-art technology for sanitary landfill operations, and satisfies the County's waste disposal needs for 26 years, until the year 2017. However, 7.8 acres of wetlands would be impacted.

Alternative 5 reduces wetland impacts to 3.9 acres while significantly decreasing cell life to about 23 years, which does not meet the project objectives.

Alternative 6 meets both objectives of minimizing wetland impacts and retaining maximum public benefits. This alternative adds approximately $500,000 to the construction cost of the project. Despite the additional costs, this is the preferred alternative since, of the practicable alternatives, it provides for the least impact to wetlands yet maintains project objectives. Total life for cells 8 and 9 would be over 26 years. Thus, Alternative 6 is the best solution for this project. It represents a reasonable compromise between minimizing wetland impacts, increased project costs, longevity of cell life, maintaining project construction schedule, and compliance with County health, safety and zoning requirements.

Re: Notice of Permit Decision
Nontidal Wetlands and Waterways Permit Application
Tracking Number: 13-NT-0282/201361335

Dear Property Owner, Public Official, or Interested Person:

After examination and consideration of the documents received and evidence in the application file and record for Millersville Landfill and Resource Recovery Facility, construction of Cell # 9 at 389 Burns Crossing Road in Severn, 21144, Anne Arundel County, the Water Management Administration has determined that the application meets the statutory and regulatory criteria necessary for issuance of a Wetlands and Waterway Permit. Copies of the permit and the Summary of the Basis for Decision are enclosed with this permit decision.

This is a final agency determination; there is no further opportunity for administrative review. Any person with standing, who is either the applicant or who participated in the public participation process through the submission or written or oral comments may petition for judicial review in the Circuit Court in the County where the permitted activity is to occur. The petition for judicial review must be filed within 30 days of the publication of the permit decision. Please see the attached Fact Sheet for additional information about the judicial review process.

If you have any questions or need any additional information, please do not hesitate to contact me at 410-537-3766.

Sincerely,

Amanda Sigillito, Chief
Nontidal Wetlands Division

/AS

Enclosures

FACT SHEET
NEW JUDICIAL REVIEW PROCESS

Legislation passed by the 2009 General Assembly changes procedures for certain permits issued by the Department, including wetlands and waterways permits. The new judicial review procedures take effect on January 1, 2010 and will apply to final permit decisions issued on and after January 1, 2010.

Under pre-existing procedures, permit applicants and third parties with standing under Maryland law could challenge the issuance of a permit or the conditions of a permit through a request for a "contested case" adjudicatory hearing conducted by the Office of Administrative Hearings.
Effective January 1, 2010, the "contested case" process no longer applies to final decisions on applications for these permits. Rather, permits can be challenged through a request for direct judicial review in the Circuit Court for the county where the activity authorized by the permit will occur. Applicants, and persons who meet standing requirements under federal law and who participated in a public comment process by submitting written or oral comments (where an opportunity for public comment was provided), may seek judicial review. Judicial review will be based on the administrative record for the permit compiled by the Department and limited to issues raised in the public comment process (unless no public comment process was provided, in which case the review will be limited to issues that are germane to the permit).

Who Has Standing?
Anyone who meets the threshold standing requirements under federal law and is either the applicant or someone who participated in the public participation process through the submission of written or oral comments, as provided in Environment Article § 5-204, Annotated Code of Maryland. The three traditional criteria for establishing standing under federal law are injury, causation, and redressability, although how each criterion is applied is highly fact-specific and varies from case to case. Further, an association has standing under federal law to bring suit on behalf of its members when its members would otherwise have standing to sue in their own right, the interests at stake are germane to the organization's purpose, and neither the claim asserted nor the relief requested requires the participation of individual members in the lawsuit.

What is the Procedure for Seeking Judicial Review?
Petitions for judicial review of a final determination or permit decision subject to judicial review must be filed in accordance with § 1-605 of the Environment Article no later than 30 days following publication by the Department of a notice of final determination or final permit decision and must be filed in the circuit court of the county where the permit application states that the proposed activity will occur. Petitions for judicial review must conform to the applicable Maryland Rules of Civil Procedure.

To review the legislation follow the link below:
http://mlis.state.md.us/2009rs/chapters_noln/Ch_650_sb1065T.pdf

For a complete list of permits that these procedures apply to follow the link below:

SUMMARY BASIS FOR DECISION

Anne Arundel County Department of Public Works Name of Applicant	13-NT-0282/201361335 Application Number
Judy Broersma /Kelly Flint Project Manager	September 10, 2014 Date of Decision

The Environment Article, Annotated Code of Maryland and the Code of Maryland Regulations establish criteria for the Maryland Department of the Environment (Department or MDE) to consider when evaluating projects that propose to change the course, current or cross section of a nontidal stream or other body of water or to impact a nontidal wetland. If the criteria are satisfied, the Department may issue a permit for the proposed activity. The Department may deny a permit for a waterway construction activity that it believes is inadequate, wasteful, dangerous, impracticable or detrimental to the best public interest. The Department may not issue a nontidal wetland permit for a regulated activity unless it finds that the applicant has demonstrated that a regulated activity, which is not water-dependent, has no practicable alternative, will minimize alteration or impairment of the nontidal wetlands, and will not cause or contribute to a degradation of ground or surface waters.

In the case of the proposed construction of Cell # 9 at the existing Millersville Landfill and Resource Recovery Facility, the question for the Department to address is whether or not the proposed project impacts are acceptable under the regulations as they pertain to such construction activities.

PUBLIC NOTICE

Adjoining property owners, local government officials and other interested persons must be notified of proposed impacts to nontidal wetlands and waterways. In addition, an opportunity to comment and request a public informational hearing must be provided via a local newspaper. The public notice on this application was published in *The Maryland Gazette* on December 4, 2013. No comments were received during the public notice period, nor was a public informational hearing requested.

PROJECT PURPOSE AND NEED

In order for the Department to authorize impacts to nontidal wetlands and their regulated buffers, regulated activities must be determined to be necessary and unavoidable to meet the basic project purpose. It is also important to note that the orderly development and use of land is regulated through planning and zoning controls implemented by the local government. In this particular instance, Anne Arundel County makes the decision about appropriate land use of the property.

The project's purpose is to provide additional landfill capacity for refuse and waste generated by the residents of Anne Arundel County when existing Cell # 8 has been filled, as described on page 5 of the July 31, 2014 *Joint Federal/State Application for the Alteration of Any Floodplain, Waterway, Tidal or Nontidal Wetland in Maryland* (Application).

ALTERNATIVES ANALYSIS

For projects that are not water-dependent, the applicant must conduct an alternatives analysis to demonstrate that the project has no practicable alternative. The factors to be considered are whether the project purpose can be accomplished using one or more alternative sites in the general area; a reduction in the size, scope, configuration or density would result in less impact; the applicant made a good faith effort to accommodate the site constraints that caused the alternative sites to be rejected; and that the regulated activity is necessary for the project to meet a demonstrated public need.

The Millersville Landfill and Resource Recovery Facility (MLF) began waste disposal operations in 1975. Cells # 1 through # 7 were in operation until 1992 when Cell 8 began operation. Cell 8 is expected to reach its disposal capacity in the next three to four years at which time disposal operations will begin in Cell 9. Cell 9 is the last cell available for waste disposal at the MLF site. The process of locating, purchasing and permitting a landfill site that can achieve social, political and economic approval is a long and difficult process. Finding an alternative site to begin waste disposal without utilizing Cell 9 does not maximize the public benefit of the existing MLF site. In permitting Cell 9, alternative designs on the existing MLF site were explored rather than alternative sites. Under the Water Quality Certification (WQC) Number 97-NT-0581/199001846 which became effective August 4, 1997, 1.8 acres of nontidal wetland and waterway impacts were authorized for the construction of Cell 9. The 1.8 acres of permanent nontidal wetland impact authorized under WQC 97-NT-0581 have been filled in construction of the perimeter road for Cell 9, the connector road between Cell 8 and Cell 9 and the construction of Stormwater Management Pond Number 9. The impacts for the shape and size of Cell 9 have been authorized and completed. For more information on the alternatives analysis completed to reach the decision under WQC 97-NT-0581, please refer to 'Alternatives Evaluation, Millersville Sanitary Landfill, Anne Arundel County, Maryland' that was prepared by Greenhorne & O'Mara, Inc., Gershman, Brickner & Bratton, Inc. and GeoSyntec Consultants in August of 1991.

This authorization is requested for impacts that would be the result of changes to a portion of the connector/perimeter road of Cell 9. Approximately, the first 500 feet of the connector road on the northern boundary of Cell 9 has a slope greater than 15 percent and has a significant curve in its horizontal alignment. Both of these existing design aspects do not meet the current standards for safe travel along the connector road. The county needs to revise the road design to remove the curve and flatten the road slope prior to beginning disposal activities in Cell 9. The proposed road bed will be raised and tied into the existing ground at stable 2:1 side slopes. In addition, the new horizontal alignment will be shifted to the north to provide a direct route to the main entrance and scale house. The fill necessary to provide a safe road slope and the revised horizontal alignment needed for direct access to the main entrance and scale house create

unavoidable impacts to nontidal wetland and waterways that were not permitted under WQC 97-NT-0581. Due to the shape and size of Cell 9, an alternative that avoids and/or minimizes impacts to nontidal wetlands and waterways is not available, as described in the "Alternatives Analysis Summary for Millersville Landfill and Resource Recovery Facility, Anne Arundel County, Maryland", Appendix A, Prepared by SCS Engineers, October 16, 2013.

AVOIDANCE AND MINIMIZATION

If the alternative site analysis is accepted, the applicant must demonstrate that adverse impacts to nontidal wetlands, their regulated buffers, and the 100-year frequency floodplain are necessary and unavoidable.

In the case of the Millersville Landfill and Resource Recovery Facility, Cell # 9, impacts to nontidal wetlands and their regulated buffers are unavoidable due to hillside seepage areas that drain to Well's Branch located within the proposed Cell. Per page 4 of the Application, the location and configuration of the Cell was approved in 1997 and cannot be changed without the loss of significant volume and capacity for waste disposal. However, impacts to the Well's Branch riparian nontidal wetlands were minimized through the use of steepened embankment slopes. Total avoidance is not possible due to the severe steepness of the existing roadway grades and the need to raise the approach elevations to achieve a safer, maximum gradient of 3% to 8%.

WATER QUALITY

Erosion and sediment control measures and stormwater management practices are designed to prevent the degradation of ground and surface water quality. Sediment pollution is addressed under Maryland's Erosion and Sediment Control Act. The law mandates local Soil Conservation Districts to review and approve erosion and sediment control plans developed in accordance with State standards. The Department's programmatic responsibilities are limited to promulgating regulations, and developing standards, ordinances and other criteria necessary to administer an erosion and sediment control program, including program oversight and delegation of enforcement authority to local governments. As a result, the Anne Arundel Soil Conservation District is responsible for the review and approval of an erosion and sediment control plan for the proposed project.

Stormwater discharges are addressed under Maryland's Stormwater Management Act. The law requires counties and municipalities to "adopt ordinances necessary to implement a stormwater management program." The Department's programmatic responsibilities are limited to promulgating regulations defining the minimum features of a stormwater ordinance and program oversight. The Department also reviews the stormwater management program of the counties and municipalities and their field implementation and requires corrective action where a program is found deficient. For most projects, compliance with the County-issued stormwater management approval ensures that the project will not degrade water quality, but for projects affecting Tier II waters, the Department will require a separate anti-degradation analysis. In this

particular case, however, the Anne Arundel County Office of Planning and Zoning is responsible for the review and approval of the project's stormwater management plan.

During the application review process, the Department verifies that appropriate best management practices are incorporated into the sediment and erosion control plans and the stormwater management plans to protect the State's water resources. In order to insure that these practices are contained in the project's final design plans, the applicant will submit approved sediment and erosion control plans and stormwater management plans to the Department prior to the commencement of construction activities authorized by the Permit.

ENDANGERED SPECIES AND FOREST INTERIOR DWELLING SPECIES

Once the application is received, it goes through a screening process. This screening process uses Geographical Information System (GIS) to determine the proposed site location and whether or not there are designated resources in the area such as rare, threatened or endangered species. If there are resources identified, the Division sends copies of the proposed plan to the appropriate agencies to review and send comments.

In a January 30, 2014 letter to the Department, the Maryland Department of Natural Resources has determined that there are no State or federal records for rare, threatened or endangered species on the project site. The wetlands and streams are in the Severn Run watershed and no instream work can be conducted between February 15 through June 15, inclusive, of any year.

HISTORIC PRESERVATION

The application was also screened using GIS for historical and archeological resources. The application was also screened using GIS for historical and archeological resources. That screening resulted in identification of a potential historic property issue. The project was referred to the Maryland Historical Trust (MHT) for further review. In a memorandum, dated September 15, 2013, MHT determined that the project would have no impact on archeological or historical resources.

MITIGATION

Mitigation is only a consideration in a permit decision after steps have been taken to avoid and minimize impacts to nontidal wetlands. In a July 9, 2014 memorandum, the Department's Mitigation and Technical Assistance Section of the Wetlands and Waterways Program, approved the Phase I Mitigation Plan for the Millersville Landfill and Resource Recovery Facility, Cell # 9.

STATE OF MARYLAND
DEPARTMENT OF THE ENVIRONMENT
WATER MANAGEMENT ADMINISTRATION
NONTIDAL WETLANDS AND WATERWAYS PERMIT

PERMIT NUMBER: 13-NT-0282/201361335

EFFECTIVE DATE: September 10, 2014

EXPIRATION DATE: September 10, 2017

PERMITTEE: Kenneth B. Flemming
Anne Arundel County Department of Public Works
2662 Riva Road
Annapolis, Maryland 21401

IN ACCORDANCE WITH ENVIRONMENT ARTICLE §5-503(a) AND §5-906(b), ANNOTATED CODE OF MARYLAND (2007 REPLACEMENT VOLUME), COMAR 26.17.04 AND 26.23.01, AND 26.08.02 AND THE ATTACHED CONDITIONS, Anne Arundel County Department of Public Works ("PERMITTEE"), IS HEREBY AUTHORIZED BY THE WATER MANAGEMENT ADMINISTRATION ("ADMINISTRATION") TO CONDUCT A REGULATED ACTIVITY IN A NONTIDAL WETLAND, BUFFER, OR EXPANDED BUFFER, AND/OR TO CHANGE THE COURSE, CURRENT OR CROSS-SECTION OF WATERS OF THE STATE, IN ACCORDANCE WITH THE ATTACHED PLANS APPROVED BY THE ADMINISTRATION ON August 13, 2014 ("APPROVED PLAN") AND PREPARED BY SCS Engineers AND INCORPORATED HEREIN, AS DESCRIBED BELOW:

The construction of Cell # 9, approximately 84 acres in size, at the existing Millersville Landfill and Resource Recovery Facility located at 389 Burns Crossing Road in Severn, Anne Arundel County. The project also includes the conversion of the existing sediment pond 9-2 (approved by the Maryland Department of the Environment, Letter of Authorization 08-NT-0026/200860367) to a stormwater management pond that will outfall into Well's Branch. Pond 9-2 will be used for sediment control during the construction of Cell # 9. The project will permanently impact 10,190 square feet of forested nontidal wetlands, 38,175 square feet of the 25-foot regulated nontidal wetlands buffer and 86 linear feet of stream channel. The nontidal wetlands drain to Severn Run, Use IV waters of the State.

1. **Validity:** Permit is valid only for use by Permittee. Permit may be transferred only with prior written approval of the Administration. In the event of transfer, transferee agrees to comply with all terms and conditions of Permit.
2. **Initiation of Work, Modifications and Extension of Term**: Permittee shall initiate authorized activities with two (2) years of the Effective Date of this Permit or the Permit shall expire. Permittee may submit written requests to the Administration for (a) extension of the period for initiation of work, (b) modification of Permit, including the Approved Plan, or, (c) not later than 45 days prior to Expiration Date, an extension of the term. Requests for modification shall be in accordance with applicable regulations and shall state reasons for changes, and shall indicate the impacts on nontidal wetlands, streams, and the floodplain, as applicable. The Administration may grant a request at its sole discretion.
3. **Responsibility and Compliance**: Permittee is fully responsible for all work performed and activities authorized by this Permit shall be performed in compliance with this Permit and Approved Plan. Permittee agrees that a copy of the Permit and Approved Plan shall be kept at the construction site and provided to its employees, agents and contractors. A person (including Permittee, its employees, agents or contractors) who violates or fails to comply with the terms and conditions of this Permit, Approved Plan or an administrative order may be subject to penalties in accordance with §5-514 and §5-911, Department of the Environment Article, Annotated Code of Maryland (2007 Replacement Volume).
4. **Failure to Comply**: If Permittee, its employees, agents or contractors fail to comply with this Permit or Approved Plan, the Administration may, in its discretion, issue an administrative order requiring Permittee, its employees, agents and contractors to cease and desist any activities which violate this Permit, or the Administration may take any other enforcement action available to it by law, including filing civil or criminal charges.
5. **Suspension or Revocation**: Permit may be suspended or revoked by the Administration, after notice of opportunity for a hearing, if Permittee: (a) submits false or inaccurate information in Permit application or subsequently required submittals; (b) deviates from the Approved Plan, specifications, terms and conditions; (c) violates, or is about to violate terms and conditions of this Permit; (d) violates, or is about to violate, any regulation promulgated pursuant to Title 5, Department of the Environment Article, Annotated Code of Maryland as amended; (e) fails to allow authorized representatives of the Administration to enter the site of authorized activities at any reasonable time to conduct inspections and evaluations; (f) fails to comply with the requirements of an administrative action or order issued by the Administration; or (g) does not have vested rights under this Permit and new information, changes in site conditions, or amended regulatory requirements necessitate revocation or suspension.
6. **Other Approvals**: Permit does not authorize any injury to private property, any invasion of rights, or any infringement of federal, State or local laws or regulations, nor does it obviate the need to obtain required authorizations or approvals from other State, federal or local agencies as required by law.
7. **Site Access:** Permittee shall allow authorized representatives of the Administration access to the site of authorized activities during normal business hours to conduct inspections and evaluations necessary to assure compliance with this Authorization. Permittee shall provide necessary assistance to effectively and safely conduct such inspections and evaluations.
8. **Inspection Notification:** Permittee shall notify the Administration's Compliance Program at least five (5) days before starting authorized activities and five (5) days after completion. For Allegany, Garrett, and Washington Counties, Permittee shall call 301-689-1480. For Carroll, Frederick, Howard, Montgomery and Prince George's Counties, Permittee shall call 301-665-2850. For Baltimore City, Anne Arundel, Baltimore, Calvert, Charles, and St. Mary's Counties, Permittee shall call 410-537-3510. For Caroline, Cecil, Dorchester, Harford, Kent, Queen Anne's, Somerset, Talbot, Wicomico and Worcester Counties, Permittee shall call 410-901-4020. If Permit is for a project that is part of a mining site, please contact the Land Management Administration's Mining Program at 410-537-3557 at least five (5) days before starting authorized activities and five (5) days after completion.
9. **Sediment Control:** Permittee shall obtain approval from the Anne Arundel Soil Conservation District for a grading and sediment control plan specifying soil erosion control measures. The approved grading and sediment control plan shall be included in the Approved Plan, and shall be available at the construction site.
10. **Federally Mandated State Authorizations:**

   X **Water Quality Certification**: Water Quality Certification is granted for this project provided that all work is performed in accordance with the authorized project description and associated conditions.

   X **Coastal Zone Consistency:** This Permit constitutes official notification that authorized activities are consistent with the Maryland Coastal Zone Management Program, as required by Section 307 of the Federal Coastal Zone Management Act of 1972, as amended. Activities within the following counties are not subject to this requirement: Allegany, Carroll, Frederick, Garrett, Howard, Montgomery, and Washington.

11. **Best Management Practices During Construction:** Permittee, its employees, agents and contractors shall conduct authorized activities in a manner consistent with the Best Management Practices specified by the Administration.
12. **Disposal of Excess:** Unless otherwise shown on the Approved Plan, all excess fill, spoil material, debris, and construction material shall be disposed of outside of nontidal wetlands, nontidal wetlands buffers, and the 100-year floodplain, and in a location and manner which does not adversely impact surface or subsurface water flow into or out of nontidal wetlands.
13. **Temporary Staging Areas:** Temporary construction trailers or structures, staging areas and stockpiles shall not be located within nontidal wetlands, nontidal wetlands buffers, or the 100-year floodplain unless specifically included on the Approved Plan.
14. **Temporary Stream Access Crossings:** Temporary stream access crossings shall not be constructed or utilized unless shown on the Approved Plan. If temporary stream access crossings are determined necessary prior to initiation of work or at any time during construction, Permittee, its employees, agents or contractors shall submit a written request to the Administration and secure the necessary permits or approvals for such crossings before installation of the crossings. Temporary stream access crossings shall be removed and the disturbance stabilized prior to completion of authorized activity or within one (1) year of installation.
15. **Discharge:** Runoff or accumulated water containing sediment or other suspended materials shall not be discharged into waters of the State unless treated by an approved sediment control device or structure.
16. **Instream Construction Prohibition:** To protect important aquatic species, motor driven construction equipment shall not be allowed within stream channels unless on authorized ford crossings. Activities within stream channels are prohibited as determined by the classification of the stream (COMAR 26.08.02.08): Severn Run is a Use IV waterway; in-stream work may not be conducted from February 15 through June 15 inclusive, of any year.
17. **Instream Blasting:** Permittee shall obtain prior written approval from the Administration before blasting or using explosives in the stream channel.
18. **Minimum Disturbance:** Any disturbance of stream banks, channel bottom, wetlands, and wetlands buffer authorized by Permit or Approved Plan shall be the minimum necessary to conduct permitted activities. All disturbed areas shall be stabilized vegetatively no later than seven (7) days after construction is completed or in accordance with the approved grading or sediment and erosion control plan.
19. **Restoration of Construction Site:** Permittee shall restore the construction site upon completion of authorized activities. Undercutting, meandering or degradation of the stream banks or channel bottom, any deposition of sediment or other materials, and any alteration of wetland vegetation, soils, or hydrology, resulting directly or indirectly from construction or authorized activities, shall be corrected by Permittee as directed by the Administration.
20. **Mitigation**: Permittee shall mitigate for the loss of 10,190 square feet of forested nontidal wetland by creating the equivalent of at least 20,380 square feet of forested nontidal wetland, in accordance with an approved Phase I conceptual mitigation plan, as may be modified by a Phase II Mitigation Plan approved by the Mitigation and Technical Assistance Section ("Section") of the Department, pursuant to COMAR 26.23.04. A Phase II Mitigation Plan shall be submitted to the Section no later than 90 days after the issuance of this Permit, unless an extension has been granted in writing by the Section. The Phase II Mitigation Plan must be approved by the Section, through the Phase II Mitigation Plan Approval Letter and its associated exhibits ("Approval Letter"), prior to commencing the impacts authorized in this Permit. The Permittee shall successfully construct the mitigation site and meet project standards and other requirements, as specified in the Approval Letter and COMAR 26.23.04, in advance or concurrently with the activities authorized in this Permit. In the event of discrepancy with the mitigation requirements found in this Condition, the standards and requirements set forth in Approval Letter shall govern. The Permittee is required to notify the Section upon the start of grading and the completion of planting of the mitigation project. The Permittee shall submit monitoring reports for the mitigation project to the Section as specified in the Approval Letter. If the Permittee as stated in the Permit, changes, the Permittee must notify the Section. If the mitigation obligation is to be transferred to another party, the Permittee must notify the Section.

U.S. ARMY CORPS OF ENGINEERS AUTHORIZATION

The U.S. Army Corps of Engineers has reviewed this activity and has granted authorization under the Maryland State Programmatic General Permit (MDSPGP-4), as a Category B Activity. The terms and conditions of the MDSPGP-4, should be followed when performing the authorized work.

PERMIT NO.: 13-NT-0282/201361335
Attachment

BEST MANAGEMENT PRACTICES FOR WORKING IN NONTIDAL WETLANDS, WETLAND BUFFERS, WATERWAYS, AND 100-YEAR FLOODPLAINS

1) No excess fill, construction material, or debris shall be stockpiled or stored in nontidal wetlands, nontidal wetland buffers, waterways, or the 100-year floodplain.
2) Place materials in a location and manner which does not adversely impact surface or subsurface water flow into or out of nontidal wetlands, nontidal wetland buffers, waterways, or the 100-year floodplain.
3) Do not use the excavated material as backfill if it contains waste metal products, unsightly debris, toxic material, or any other deleterious substance. If additional backfill is required, use clean material free of waste metal products, unsightly debris, toxic material, or any other deleterious substance.
4) Place heavy equipment on mats or suitably operate the equipment to prevent damage to nontidal wetlands, nontidal wetland buffers, waterways, or the 100-year floodplain.
5) Repair and maintain any serviceable structure or fill so there is no permanent loss of nontidal wetlands, nontidal wetland buffers, or waterways, or permanent modification of the 100-year floodplain in excess of that lost under the originally authorized structure or fill.
6) Rectify any nontidal wetlands, wetland buffers, waterways, or 100-year floodplain temporarily impacted by any construction.
7) All stabilization in the nontidal wetland and nontidal wetland buffer shall consist of the following species: Annual Ryegrass (Lolium multiflorum), Millet (Setaria italica), Barley (Hordeum sp.), Oats (Uniola sp.), and/or Rye (Secale cereale). These species will allow for the stabilization of the site while also allowing for the voluntary revegetation of natural wetland species. Other non-persistent vegetation may be acceptable, but must be approved by the Nontidal Wetlands and Waterways Division. **Kentucky 31 fescue shall not be utilized in wetland or buffer areas.** The area should be seeded and mulched to reduce erosion after construction activities have been completed.
8) After installation has been completed, make post-construction grades and elevations the same as the original grades and elevations in temporarily impacted areas.
9) To protect aquatic species, in-stream work is prohibited as determined by the classification of the stream:

   Use I waters: In-stream work shall not be conducted during the period February 15 through June 15, inclusive, during any year.

10) Stormwater runoff from impervious surfaces shall be controlled to prevent the washing of debris into the waterway.
11) Culverts shall be constructed and any riprap placed so as not to obstruct the movement of aquatic species, unless the purpose of the activity is to impound water.

USACE Baltimore District Authorization - Millersville Landfill Cell 9 Stream Restoration (2014)

DEPARTMENT OF THE ARMY
BALTIMORE DISTRICT, U.S. ARMY CORPS OF ENGINEERS
P.O. BOX 1715
BALTIMORE, MD 21203-1715

DEC 0 2 2014

RECEIVED
DEC 4 2014
BY:

Operations Division

SUBJECT: **CENAB-OP-RMN (Anne Arundel County DPW/ Millersville Landfill Cell 9/Stream Restoration) 2013-61335-M18**

Mr. Kenneth B. Fleming, P.E.
Anne Arundel County Department of Public Works
2664 Riva Road
Annapolis, Maryland 21401

Dear Mr. Fleming:

This is in reference to your application dated August 2013 wherein you requested Department of the Army (DA) authorization to construct Cell 9, at the existing Millersville Landfill and Resource Recovery Facility at 389 Burns Crossing Road in Severn, Anne Arundel County, Maryland. The construction of Cell 9 will impact approximately 10,190 square feet of forested nontidal wetlands and approximately 86 linear feet of an unnamed, non-tidal tributary to Wells Branch. Also authorized are associated impacts for the proposed restoration of approximately 1,600 linear feet of stream and approximately 39,000 square feet of forested nontidal wetlands of Wells Branch, a perennial stream located on the landfill property. The construction of Cell 9 will be performed in accordance with the enclosed revised plans dated July 2013, and the associated stream restoration work will be performed in accordance with the enclosed revised plans dated November 2013.

The U. S. Army Corps of Engineers, Baltimore District, has determined that the proposed work, if accomplished in accordance with the enclosed plan(s), is authorized as a Category B, Activity e(9) *"Residential, Commercial, and Institutional Development"* under the Maryland State Programmatic General Permit-4 (MDSPGP-4). This general permit was published in the Corps Special Public Notice #11-77 issued on September 28, 2011. This MDSPGP-4 verification is provided pursuant to Section 404 of the Clean Water Act. If any of the information contained in your application and/or plans is later found to be in error, the MDSPGP-4 authorization for your project may be modified, suspended, or revoked.

The enclosed list of activity-specific impact limits and requirements and general conditions must be followed for purposes of the MDSPGP-4 in performing the work. In addition to the enclosed list of conditions, you must also comply with the following special conditions:

1. To protect aquatic species in-stream work is prohibited during the period February 15 through June 15, inclusive, during any year.

2. The permittee must have a copy of this permit available on site during construction.

3. The permittee must allow representatives of the Corps to enter the project area to inspect the ongoing or completed work.

4. Best management practices must be employed to minimize impacts to wetlands and waterways. Construction material must not be stockpiled in or stored in a manner that

would impact waters of the U.S., including jurisdictional wetlands. Temporary disturbance to wetlands and waterways must be restored to preconstruction

As a condition of the MDSPGP-4 authorization, you are required to complete and sign the enclosed **Compliance Self-Certification Form** regarding the completed work and any required mitigation. The signed form should be returned to the Regulatory Branch at the above address within 60 days following completion of the authorized work. Your signature on the self-certification form verifies your understanding that the work was completed in accordance with the terms and conditions associated with your DA permit.

This permit verification, including the computation of impacts and any required compensatory mitigation requirements, is based on a preliminary jurisdictional determination (JD). This preliminary JD finds that there "may be" waters of the United States within the review area shown on the project plans dated July 2013 and November 2013, a copy of which is enclosed, and identifies all potential jurisdictional waters and wetlands within the review area that could be affected by the proposed activity. This preliminary JD is not appealable.

If you do not agree with the extent of waters or wetlands and this preliminary JD upon which this permit verification was based, you are hereby advised of your option to request and obtain an approved JD from this office before accepting the terms and conditions of this permit verification. An approved JD is an official, written Corps determination stating the presence or absence of jurisdictional waters of the United States and identifies the limits of waters of the United States on a project site. An approved JD can be relied upon for a period of five years and can be appealed through the Corps' administrative appeal process (33 CFR Part 331).

Undertaking any activity in reliance on a Corps permit authorization based on a preliminary JD means that you accept the permit in entirety, and waive all rights to appeal the permit, including its terms and conditions and the preliminary JD associated with this permit.

Please be aware that the terms and conditions of this permit will continue to be binding on the new property owner(s) if structures or work authorized by this permit exist at the time of ownership transfer of the associated property. Although the construction period for work authorized by this MDSPGP-4 is finite, the permit itself, with its limitations, does not expire. To validate the transfer of this permit and the legal responsibility to comply with its terms and conditions, the transferee (new owner) must provide a mailing address and telephone number along with their signature and date in the space provided below and mail a copy to the above address.

Your MDSPGP-4 authorization is valid until September 30, 2016 unless the permit is modified, reissued, or revoked. You must remain informed of the changes to the MDSPGP-4. When changes to the MDSPGP-4 occur, a public notice announcing the changes will be issued.

Be advised that you have 12 months from the effective date of the MDSPGP-4's expiration, modification or revocation to complete the work under the present terms and conditions provided you have commenced construction or are under contract to commence construction of the authorized work.

In order for this authorization to be valid, you must obtain all required Federal, State, and local permits. If you have any questions concerning this letter, please contact Mr. Richard Kibby at (410) 962-0694 or *richard.kibby@usace.army.mil*.

Sincerely,

Richard Kibby

P.O. BOX 1715
BALTIMORE, MD 21203-1715

REPLY TO
ATTENTION OF

Effective October 1, 2011

2013-61335-M18
Corps Permit Number

CENAB-OP-R-MDSPGP-4 (MARYLAND STATE PROGRAMMATIC GENERAL PERMIT-4)

TO WHOM IT MAY CONCERN:

Upon the recommendation of the Chief of Engineers, and under the provisions of Section 404 of the Clean Water Act, as amended, and Section 10 of the Rivers and Harbors Act of 1899 (33 U.S.C. 403), the Secretary of the Army hereby authorizes the discharge of dredged or fill material or the placement of structures into Waters of the United States, including wetlands and navigable waters. These discharges and structures must comply with all the terms and conditions identified in this MDSPGP-4. It has been determined that the project qualifies for the MDSPGP-4. Accordingly, you are authorized to undertake the activity pursuant to:

1. Section 10 of the Rivers and Harbors Act of 1899 (33 U.S.C. 403); and/or
2. Section 404 of the Clean Water Act (33 U.S.C. 1344).

You are authorized to perform work in accordance with the terms and conditions specified in Section VII of the MDSPGP-4 effective on October 1, 2011.

VII. General Conditions: To qualify for MDSPGP-4 authorization, the prospective permittee must comply with the following general conditions, as appropriate, in addition to any activity-specific conditions in the MDSPGP-4 category list and any case-specific special conditions imposed by the Corps.

A. General Requirements:

1. **Other Permits:** Authorization under the MDSPGP-4 does not obviate the need to obtain other Federal, State, or local authorizations required by law.

2. **Geographic Jurisdiction:** This MDSPGP-4 will authorize work undertaken within the geographic limits of the State of Maryland under the regulatory jurisdiction of the Baltimore District.

3. **Applicability:** Applicability of the MDSPGP-4 shall be reviewed with reference to the Corps definition of waters of the United States, including wetlands, and navigable waters of the United States. Applicants are responsible for delineating boundaries of all waters of the United States, including wetland boundaries. The delineation of wetland boundaries shall be accomplished in accordance with the current Federal manual for identifying jurisdictional wetlands and appropriate guidance issued by the Corps of Engineers.

4. **Minimal Effects:** Projects authorized by the MDSPGP-4 shall have no more than minimal individual and cumulative adverse environmental effects.

5. **Discretionary Authority:** Notwithstanding compliance with the terms and conditions of the MDSPGP-4, the Corps retains discretionary authority to require an alternate Corps permit review for any project under all categories of the MDSPGP-4 based on concerns for the aquatic environment or for any other factor of the public interest. This authority may be invoked on a case-by-case basis during the review process for Category B activities whenever the Corps determines that, based on the concerns stated above, the potential consequences of the proposed project warrant individual review. In some rare instances, the Corps may have concerns for the aquatic environment or for any other public interest factor pertaining to a specific proposed project, which has already received a case-specific verification as a Category A activity. In order to evaluate this project under an alternate Corps permit review, the verification must be suspended in accordance with Section VIII.E of the MDSPGP-4.

Whenever the Corps notifies an applicant that an alternate Corps permit may be required, authorization under the MDSPGP-4 is voided. No work may be conducted until the individual Corps permit is obtained, or until the Corps notifies the applicant that further review has demonstrated that the work may proceed under the MDSPGP-4.

6. **Single and Complete Projects:** The MDSPGP-4 shall not be used for piecemeal work and shall be applied to single and complete projects, including maintenance activities. For purposes of this MDSPGP-4, a single and complete project means the total project proposed or accomplished by one owner/developer or partnership or other association of owners/developers and which has independent utility. All components of a project, including all attendant features both temporary and permanent, shall be reviewed together as constituting one single and complete project. All planned phases of multi-phased projects (e.g., subdivisions should include all work such as roads, utilities, and lot development) shall be applied for and reviewed together as constituting one single and complete project. The MDSPGP-4 shall not be used for any activity or portion of a project (e.g., a pier or boat ramp), that is part of, or dependent on, an overall project (e.g., the dredging of a main navigation channel or a spur channel), for which an individual permit or some other alternate Corps permit is required.

7. **Use of Multiple MDSPGP-4 Activities:** More than one MDSPGP-4 activity may be used to authorize a single and complete project. However, the specific requirements, including all activity-specific requirements and impact thresholds, must be met for each MDSPGP-4 activity and the total extent of project impacts must not exceed the acreage and/or linear foot limit of the MDSPGP-4 activity with the highest specified acreage and/or linear foot limit. For example, if a road crossing is authorized under Category A of Section IV.B.1.(d)(1) with an associated nontidal bank stabilization authorized under Section IV.B.1.f.(4)(a), the maximum total impact limits to nontidal waters of the United States for the single and complete project may not exceed 10,000 square feet in total area and/or 500 linear feet in total length. The road crossing and nontidal bank stabilization activities must still meet all Category A activity-specific requirements and impact thresholds.

A single and complete project with multiple impacts, that may be eligible for authorization under a Category A and a Category B activity, requires an application submittal to the Corps and review under the MDSPGP-4 Category B verification procedures. All specific requirements, including the activity-specific requirements and impact thresholds of the Category A activity and the Category B activity must be met and the total extent of project impacts must not exceed to total acreage and/or linear foot limit of the MDSPGP-4 activity with the highest specified acreage and/or linear foot limit. For example, if a road crossing is authorized under Category A of Section IV.B.1.(d)(1) with an associated nontidal bank stabilization authorized under Section IV.B.f.(4)(b), the maximum total impact limits to waters of the United States for the single and complete project may not exceed 1/2 acre (21,780 square feet) in total area and/or 2,000 linear feet in total length. The road crossing activity must meet the Category A activity-specific requirements and impact thresholds, and the nontidal bank stabilization activity must meet the Category B activity-specific requirements and impact thresholds.

8. **Permit On-Site:** The permittee shall ensure that a copy of the MDSPGP-4 and the accompanying authorization letter are at the work site at all times. These copies must be made available to any regulatory representative upon request. Although the permittee may assign various aspects of the work to different contractors or sub-contractors, all contractors and sub-contractors shall be expected to comply with all conditions of any general permit authorization.

9. **Authorized Activities in Navigable Waters Subject to Section 10 of the Rivers and Harbors Act of 1899:**

a. If future operations by the United States require removal, relocation, or other alteration of the structure or work herein authorized, or if, in the opinion of the Secretary of the Army or his authorized representative, said structure or work shall cause unreasonable obstruction to the free navigation of the navigable water, the permittee will be required, upon due notice from the Corps, to remove, relocate, or alter the structural work or obstructions caused thereby, without expense to the United States. No claim shall be made against the United States on account of any such removal or alteration.

b. The permittee acknowledges the possibility that the structure permitted herein may be subject to damage by wave wash from passing vessels and/or ice flows within the waterway. The issuance of this permit does not relieve the permittee from taking all proper steps to ensure the integrity of the structure permitted herein and the safety of vessels moored thereto from damage by wave wash and/or ice flows, and the permittee shall not hold the United States liable for such damage.

c. The permittee must install and maintain, at his/her expense any safety lights, markers, and/or signals prescribed by the USCG, through regulations or otherwise, on the authorized facilities and/or structures. The permittee must contact the Commander (AOWW), Fifth Coast Guard District, Federal Building, 431 Crawford

Street, Portsmouth, Virginia, 23704, to ascertain the need for obstruction lights. Prior to commencing the construction or installation of an authorized structure in navigable waters of the United States, the permittee must submit a "Private Aids to Navigation Application" to the Commander of the USCG.

d. The permittee must provide location coordinates of the authorized structures, including minimum depth and other pertinent information to the USCG and request that a Local Notice to Mariners is issued regarding the authorized work.

10. For Aerial Transmission Lines Across Navigable Waters: The following minimum clearances are required for aerial electric power transmission lines crossing navigable waters of the United States. These clearances are related to the clearances over the navigable channel provided by existing fixed bridges, or the clearances which would be required by the USCG for new fixed bridges, in the vicinity of the proposed aerial transmission line. These clearances are based on the low point of the line under conditions producing the greatest sag, taking into consideration temperature, load, wind, length of span, and type of supports as outlined in the National Electrical Safety Code:

NOMINAL SYSTEM VOLTAGE (kV)	Minimum additional clearance (ft.) above clearance required for bridges.
115 and below	20
138	22
161	24
230	26
350	30
500	35
700	42
750-765	45

a. Clearances for communication lines, stream gauging cables, ferry cables, and other aerial crossings must be a minimum of ten feet above clearances required for bridges, unless specifically authorized otherwise by the District Engineer.

b. Corps Regulation ER 1110-2-4401 prescribes minimum vertical clearances for power communication lines over Corps lake projects. In instances where both the National Electrical Safety Code requirements and ER 1110-2-4401 apply, the greater minimum clearance is required.

A. **National Concern:**

1. **Historic Properties:** Any activity authorized by the MDSPGP-4 shall comply with Section 106 of the National Historic Preservation Act. Maryland Department of the Environment, in cooperation with the Maryland Historic Preservation Office, shall conduct an initial review and notify the Corps if any archaeological or other cultural resources are in the vicinity of the project. The Corps may require applicants to perform a survey of archaeological and historical resources in the project area. The Corps shall determine whether National Historic Preservation Act Section 106 consultation is required. The applicant must notify the Corps if they have knowledge that the activity may affect any historic properties listed or eligible for listing, or that the applicant has reason to believe may be eligible for listing on the National Register of Historic Places. If the permittee discovers any previously unknown archaeological or other cultural resource while accomplishing the work authorized by the MDSPGP-4, the permittee shall immediately notify the Corps of what has been found and stop work in the permit area until the required coordination has been completed. The permittee shall not begin or continue work until notified by the District Engineer that the requirements of the National Historic Preservation Act have been satisfied

and that the activity may proceed. Information on the location and existence of historical resources can be obtained from the MHT, Office of Preservation Services, and the National Register of Historic Places.

2. **Tribal Rights:** No activity or its operation may impair reserved tribal rights, including but not limited to, reserved water rights and treaty fishing and hunting rights.

3. **National Lands:** Activities authorized by the MDSPGP-4 shall not impinge upon the value of any Federal land, including but not limited to, National Wildlife Refuges, National Forests, National Parks, National Marine Sanctuaries, or any area administered by the FWS, U.S. Forest Service, or National Park Service (e.g., Assateague Island National Seashore).

4. **Endangered Species:** The MDSPGP-4 does not authorize any activity that may directly or indirectly affect a threatened or endangered species or a species proposed for such designation, as identified under the Federal ESA; or which may directly or indirectly destroy or adversely modify the critical habitat of such species unless and until appropriate coordination with the applicable resource agency(s) is complete and all such issues are resolved in accordance with the applicable regulations and procedures. MDE, in cooperation with MD DNR, shall conduct an initial review and notify the Corps and FWS or NMFS if any Federally listed species or critical habitat is likely to be in the vicinity of the project. The Corps shall determine if consultation with FWS or NMFS is required under Section 7 of the ESA. If consultation is required, the applicant, after notification, shall not begin or continue work until notified by the Corps that the requirements of the ESA have been satisfied and that the activity is eligible for authorization. Information on the location of threatened and endangered species and their critical habitat can be obtained from FWS and NMFS. The Corps will be initiating consultation under the Endangered Species Act on this MDSPGP-4 and any conditions from that consultation will be inserted into the MDSPGP-4.

National Marine Fisheries Service – Endangered Species Act Requirements:

a. **Interactions with National Marine Fisheries Service Federally Threatened or Endangered Species:** Any interaction between a sea turtle or any species listed now or in the future under Federal law as a threatened or endangered species ("listed species") (e.g., North Atlantic right whale, humpback whale, shortnose sturgeon) and the vessels associated with the project must be reported to the NMFS as follows: If the animal appears alive and uninjured (i.e., breathing normally, no visible wounds, movement uninhibited), the permittee or its representative must report the incident to the NMFS Northeast Region Marine Mammal and Sea Turtle Stranding and Entanglement Hotline at (866) 755-6622 within 24 hours of returning from the trip on which they made the discovery. If the animal requires assistance, the call to the hotline must be made immediately. If the animal appears to be injured (i.e. bleeding, gasping for air, etc.) or dead, the permittee or its representative must also immediately call the hotline so the appropriate rehabilitation or stranding network representative can be contacted. The applicant shall also notify the Corps of all correspondence and interaction with the NMFS within two calendar days. Additional information about any Federally threatened or endangered species may be obtained from the attached fact sheet or online at: http://www.nero.noaa.gov/prot_res/stranding/SpeciesOverview.html and at: http://www.nero.noaa.gov/prot_res/esp/. An interaction is defined as an entanglement or capture of a listed species or a strike/direct contact between vessels or equipment used for the project and a listed species.

b. **Vessel Buffer:** When listed species are sighted, vessels must attempt to maintain a distance of 50 yards (150 feet) or greater between the animal and the vessel whenever possible. State and Federal regulations prohibit approaching a right whale within a 500 yard (1,500 foot) buffer zone. Any vessel finding itself within the 500 yard (1,500 foot) buffer zone created by a surfacing right whale must depart immediately at a safe, slow speed. If other listed species are detected, vessels will reduce their speeds to 10 knots or to the maximum extent practicable to ensure human safety. If listed species are sighted off of a moving dredge, intentional approaches within 100 yards (300 feet) of the animal must be avoided. Vessels must reduce speeds to 4 knots or the lowest speed practicable to ensure human safety. Any interactions must be reported to the NMFS.

c. **Best Management Practices Applicable to Category A Activities Within Tidal Waters Having Salinity Levels Less Than 6 Parts Per Thousand (ppt) (See Appendix B):**

(i) Pile Driving: For the protection of listed species within all tidal waters of the Chesapeake Bay in Maryland and its tidal tributaries with salinity levels <6 ppt, pile driving methods must maintain noise level thresholds not to exceed 187dB SEL re 1μPa or 206dB peak re 1μPa at a distance of >10m from the pile being installed; and for levels >155dB peak re 1μPa must not exceed 12 consecutive hours on any given day and a 12 hour

recovery period (i.e., in-water noise levels below 155dB peak re 1μPa) must be provided between work days. Pile driving construction must adhere to one of the following methods: (a) piles must be installed in-the-dry during low water; or (b) piles must be drilled and pinned to ledge; or (c) vibratory hammers must be used to install any size and quantity of wood, concrete, or steel pilings; or (d) impact hammers must be limited to one hammer and <50 piles installed per day with the following: wood piles of any size; concrete piles <18-inches diameter; steel piles <12-inch diameter if the hammer is <3,000 pounds and a wood cushion is used between the hammer and steel pile; or (e) approved pile driving methods that will allow noise level thresholds to be met.

(ii) Sediment Disturbing Activities Time-of-Year Restriction: Sediment disturbing activities, which includes pile driving activities, are prohibited during the period April 1 through June 30 within all tidal waters of the Chesapeake Bay in Maryland and its tidal tributaries with salinity levels <6 ppt for the protection of shortnose sturgeon and early life stages in these waters.

5. **Essential Fish Habitat (EFH) and Fish and Wildlife Coordination Act:** Section 305(b)(2) of the Magnuson-Stevens Fishery Conservation and Management Act requires an EFH consultation with the NMFS for any action or proposed action authorized, funded, or undertaken by a Federal agency that may adversely affect EFH. Essential Fish Habitat has been defined by Congress as "those waters and substrate necessary to fish for spawning, breeding, feeding, or growth to maturity." The designation and conservation of EFH seeks to minimize adverse effects on habitat caused by fishing and non-fishing activities. NMFS has determined that many of the MDSPGP-4 Category A activities are eligible for EFH general or programmatic concurrence and require no further EFH consultation. National Marine Fisheries Service, in consultation with the District, has determined that individual EFH consultation is needed for some projects potentially eligible for authorization under Category A of the MDSPGP-4 that may adversely affect EFH. The Corps will coordinate with NMFS as part of the Category B review procedures. EFH conservation recommendations made by NMFS will normally be included as a permit requirement by the Corps. If the EFH coordination and consultation requirements cannot be resolved under the MDSPGP-4 process, an alternate Corps permit review process is required for the project. The Corps will be initiating consultation under these authorities on this MDSPGP-4, and any conditions from that consultation to protect NOAA trust resources will be inserted into this MDSPGP-4.

6. **Wild and Scenic Rivers:** No activity is authorized under the MDSPGP-4 that occurs in a component of the National Wild and Scenic River System, including rivers officially designated by Congress as study rivers for possible inclusion in the system, while such rivers are in an official study status, unless the appropriate Federal agency, with direct management responsibility for the river, has determined in writing that the proposed activity will not adversely affect any National Wild and Scenic River, including study rivers. Information on Wild and Scenic Rivers may be obtained from the appropriate Federal land management agency in the area (e.g., National Park Service, U. S. Forest Service, Bureau of Land Management, or FWS).

7. **Federally Authorized Civil Works Projects:**

a. **Federal Navigation Projects:** The MDSPGP-4 does not authorize interference with any existing or proposed Federal navigation projects. The permittee understands and agrees that, if future operations by the United States require the removal, relocation, or other alteration of the structure or work herein authorized, or if, in the opinion of the Secretary of the Army or his authorized representative, said structure or work shall cause unreasonable obstruction to the free navigation of the navigable waters, the permittee will be required, upon due notice from the Corps, to remove, relocate, or alter the structural work or obstructions caused thereby, without expense to the United States. No claim shall be made against the United States on account of any such removal or alteration. (See VII.A.9.a.)

b. **Federal Navigation Channel Setbacks:** All activities must comply with the Baltimore District Minimum Setback Guidance for Structures Along Federally Authorized Channels. Please see the Baltimore District's Regulatory webpage to view this guidance: http://www.nab.usace.army.mil/Wetlands%20Permits/publications.htm.

c. **Other Federally Authorized Civil Work Projects (e.g., flood control, dams, and reservoirs):** The MDSPGP-4 does not authorize interference with any proposed or existing Federally authorized civil works project.

8. **Federal Liability:** In issuing this permit, the Federal Government does not assume any liability for the following:

a. Damages to the permitted project, or uses thereof, as a result of other permitted or unpermitted activities or from natural causes;

b. Damages to the permitted project or uses thereof as a result of current or future activities undertaken by or on behalf of the United States in the public interest;

c. Damages to persons, property, or to other permitted or unpermitted activities or structures caused by the activity authorized by this permit;

d. Design or construction deficiencies associated with the permitted work; and

e. Damage claims associated with any future modification, suspension or revocation of the MDSPGP-4 or any specific MDSPGP-4 verification.

9. **Navigation:** Projects authorized under the MDSPGP-4 shall not cause interference with navigation, and no attempt shall be made by the permittee to prevent the full and free use by the public of all navigable waters at or adjacent to projects authorized under the MDSPGP-4. Nothing in the MDSPGP-4 shall in any way restrict the District Engineer, U.S. Army Engineer District, Baltimore, from exercising his legal authority to protect the public interest in navigation or from exercising his authority under the Navigation Servitude of the United States. (See VII.B.8.)

10. **Fills Within 100-Year Floodplain:** The activity must comply with applicable Federal Emergency Management Agency approved State or local floodplain management requirements.

11. **Safety of Impoundment Structures:** To ensure that all impoundment structures are safely designed, the Corps may require non-Federal applicants to demonstrate that the structures comply with established State dam safety criteria or have been designed by qualified persons. The Corps may also require documentation that the design has been independently reviewed by similarly qualified persons, and appropriate modifications made to ensure safety.

B. **Minimization of Environmental Impacts:**

1. **Avoidance and Minimization:** Discharges of dredged or fill material into waters of the United States and adverse impacts of such discharges on the aquatic ecosystem shall be avoided and minimized to the maximum extent practicable at the project site (i.e., on-site).

2. **Mitigation Standards:** A proposed compensatory mitigation proposal may be submitted with the application to expedite the process. The Corps will determine if the project is eligible for authorization under the MDSPGP-4 subject to the applicant's submittal of a compensatory mitigation proposal for stream and wetland impacts. Compensatory mitigation plans will generally include a requirement for the establishment, performance, maintenance, legal protection (e.g., conservation easements), and long-term management of the mitigation area. Applicants may propose the use of mitigation banks, in-lieu-fee programs, or separate permittee-responsible mitigation. In general, maintenance of previously authorized activities typically does not require mitigation. All mitigation must be in compliance with the 2008 Mitigation Rule (73 FR 70).

a. Wetland mitigation will generally be required for all permanent tidal or nontidal wetland losses either through the use of the State's tidal or nontidal programmatic wetland compensation, mitigation banks, in-lieu-fee programs, and/or by the permittee as required by special condition of the MDSPGP-4 or the State authorization. Generally, the minimum required wetland mitigation ratios will be as follows: 2:1 for forested and scrub-shrub wetlands; 1:1 for herbaceous emergent wetlands, and 1:1 for permanent conversion of forested wetlands to herbaceous emergent wetlands. Wetland mitigation can include wetland restoration, establishment, enhancement (including restoration or enhancement of upland forested buffers), and/or wetland preservation, unless the Corps determines in writing that some other form of mitigation would be more appropriate and provides a project-specific waiver of this requirement. Since the likelihood of success is greater and the impacts are reduced, wetland restoration should be the first compensatory mitigation option considered.

b. Stream mitigation, focusing on functional replacement, will generally be required for any project that involves losses of more than 200 linear feet to stream channels and rivers through the use of mitigation banks, in-lieu-fee programs, or by the permittee as required by special condition of the MDSPGP-4 and/or the State authorization. Stream mitigation can include stream restoration, establishment, enhancement (including enhancement of riparian buffers), and stream preservation. Riparian buffer areas should consist of native species. The width of the required riparian area will address documented water quality or aquatic habitat impact concerns. The need to require mitigation for impacts to open waters will be determined on a case-by-case basis.

c. For activities resulting in the loss of marine or estuarine resources, permittee-responsible compensatory mitigation may be environmentally preferable if there are no mitigation banks or in-lieu-fee programs in the area that have marine or estuarine credits available for sale or transfer to the permittee.

d. For permittee-responsible mitigation, the special conditions of the MDSPGP-4 verification must clearly indicate the party or parties responsible for the implementation, performance, and long-term management of the compensatory mitigation project.

3. **Work in Wetlands:** Heavy equipment working in wetlands shall be avoided if possible and, if required, soil and vegetation disturbance shall be minimized by using techniques such as timber mats, geotextile fabric, and vehicles with low-pressure tires. Disturbed areas in wetlands shall be restored to preconstruction contours and elevations upon completion of the work.

4. **Temporary Fill and Mats**: Temporary fill and the use of mats are both considered a discharge of fill material and must be included in the quantification of impact area authorized by the MDSPGP-4. Temporary fill (e.g., access roads, cofferdams) in waters and wetlands authorized by the MDSPGP-4 shall be properly stabilized during use to prevent erosion. Temporary fill in wetlands shall be placed on geotextile fabric laid on the existing wetland grade. Upon completion of the work, all temporary fills shall be disposed of at an upland site, suitably contained to prevent erosion and transport to a waterway or wetland. Temporary fill areas shall be restored to their original, pre-construction contours and revegetated with native wetland species.

5. **Erosion and Sediment Control:** Adequate erosion and sediment control measures, practices, and devices, such as turbidity curtains in tidal waters, vegetated filter strips, geotextile silt fences, phased construction, or other devices or methods, shall be used to reduce erosion and retain sediment on-site during and after construction. These devices and methods shall be capable of (a) preventing erosion, (b) collecting sediment and suspended and floating materials, and (c) filtering fine sediment. Erosion and sediment control devices shall be removed when the work is complete and the site has been successfully stabilized. The sediment collected by these devices shall be removed and placed at an upland location, in a manner that will prevent its later erosion into a waterway or wetland. All exposed soil and other fills shall be permanently stabilized at the earliest practicable date. In-stream work shall be conducted "in the dry" whenever practicable. This should be accomplished using stream diversion devices, other than earthen or stone cofferdams. In addition, work in waters of the United States should be performed during periods of low-flow or no-flow, whenever practicable.

6. **Aquatic Life Movements:** No activity may substantially disrupt the necessary life-cycle movements of those species of aquatic life indigenous to the waterbody, including those species that normally migrate through, or spawn/nursery within the area (e.g., anadromous/catadromous fish); unless the activity's primary purpose is to impound water. Culverts placed in streams must be installed to maintain low flow conditions. A low flow channel must be maintained through any discharges placed for armoring across the channel so as to not impede flow in the waterway and/or not to block or impede the movements of anadromous, estuarine, and resident fish. Permanent culvert or pipes placed in streams must be depressed in accordance with the State of Maryland regulations. If depression of the culvert is not practicable, the applicant must submit a narrative, along with their application, documenting measures evaluated to minimize disruption of the movement of aquatic life, as well as specific documentation concerning site conditions and limitations on depressing the culvert, cost, and engineering factors that prohibit depressing the pipe/culvert. Options that need to be considered include the use of a bridge, bottomless pipe, partial depression, or other measures to provide for the movement of aquatic organisms. The documentation must also include photographs documenting site conditions. The applicant may find it helpful to contact their regional fishery agency for recommendations about the measures to be taken to allow for fish passage

7. **Water Crossings:**

a. All temporary and permanent crossings of waterbodies shall be suitably bridged, culverted, or otherwise constructed to withstand and to prevent the restriction of high flows and tidal flows; to maintain existing low flows; and to prevent the obstruction of movement by aquatic life indigenous to the water body, including anadromous, estuarine, and resident fish species.

b. All water crossings (e.g., utility lines and road crossings) must be constructed roughly perpendicular to waters of the United States, including streams and wetlands. Where a utility line or access road is constructed parallel to a stream corridor, an undisturbed buffer shall be maintained between the utility line/access road and the waterway to avoid or minimize potential future impacts to waters of the United States. These potential impacts would include such issues as sewer line leaks or failures, future stream channel meandering, stream bank instability and failure, and right-of-way maintenance.

c. Water crossings must be constructed "in the dry" whenever practicable. This should be accomplished by using stream diversion devices other than earthen or stone cofferdams.

d. Equipment shall cross streams only at suitably constructed permanent or temporary crossings.

e. Temporary structures and fills shall be removed and the area restored to its original contours and elevations, or to the conditions specified in the approved plans. The temporary structures and the areas of fill associated with these structures must be included in the total waterway/wetlands impacts.

8. **Discharge of Pollutants:** All activities that are authorized under the MDSPGP-4 and that involve any discharge or relocation of pollutants into waters of the United States shall be consistent with applicable water quality standards, effluent limitations, standards of performance, prohibitions, and pretreatment standards and management practices established pursuant to the CWA (33 U.S.C. 1251 et. Seq.), and applicable State and local laws and regulations. No discharge of dredged or fill material in association with this authorization may consist of unsuitable material such as trash, debris, car bodies, asphalt, etc.

9. **Spawning Areas:** Activities, including structures and work in navigable waters of the United States or discharges of dredged or fill materials in fish and shellfish spawning or nursery areas during spawning seasons, shall be avoided. Impacts to these areas shall be avoided or minimized to the maximum extent practicable during all other times of year. Activities that result in the physical destruction (e.g., through excavation, dredging, mining, fill, or significant downstream sedimentation by substantial turbidity) of an important spawning/nursery area are not authorized by this MDSPGP-4.

10. **Waterfowl Breeding and Wintering Areas:** Discharges into breeding and wintering areas for migratory waterfowl shall be avoided to the maximum extent practicable.

11. **Environmental Values:** The permittee shall make every reasonable effort to construct or operate the work authorized under the MDSPGP-4 in a manner that maintains as many environmental values as practicable, and that avoids or minimizes any adverse impacts on existing fish, wildlife, and natural environmental values.

12. **Management of Water Flows:** To the maximum extent practicable, the pre-construction course, condition, capacity, and location of open waters must be maintained for each activity, including stream channelization and storm water management activities. The activity must be constructed to withstand expected high flows. The activity must not restrict or impede the passage of normal or high flows. The activity may alter the pre-construction course, condition, capacity, and location of open waters if it benefits the aquatic environment (e.g., stream restoration or relocation activities).

13. **Water Supply Intakes:** No discharge of dredged or fill material may occur in the proximity of a public water supply intake.

D. **Procedural Conditions:**

1. **Inspections:** The permittee shall permit the District Engineer or his authorized representative(s) to make periodic inspections at any time deemed necessary to ensure that the work is being performed in accordance with the terms and conditions of the MDSPGP-4. The District Engineer may also require post-construction engineering drawings (as-built plans) for completed work, and post-dredging survey drawings for any dredging work.

2. **Compliance Certification:** Every permittee who receives a written MDSPGP-4 verification shall submit a signed Compliance Certification Form within 60 days following completion of the authorized work and any required mitigation (but not mitigation monitoring, which requires separate submittals). Failure to submit the Compliance Certification Form by the permittee could result in the Corps taking appropriate non-compliance enforcement action against the permit holder. The Corps will provide a blank copy of the Compliance Certification Form to the permittee with the MDSPGP-4 verification. The completed form will include the following:

a. A statement that the authorized work either was or was not done in accordance with the MDSPGP-4 verification, including any general and/or specific conditions. If the activity was not done in accordance with the MDSPGP-4 verification, including any general and/or specific conditions and requirements, the permittee shall describe the specifics of the deviation from the authorized activity.

b. A statement that any required mitigation was or was not completed in accordance with the permit conditions. If the mitigation was not completed in accordance with the permit conditions, the permittee shall describe the specifics of the deviation from the permit conditions.

c. The signature of the permittee, certifying the completion of the work and compensatory mitigation.

After the project is completed, the certification shall be sent to the Baltimore District at the following address:

U. S. Army Corps of Engineers
Baltimore District
Attn: CENAB-OP-R
P. O. Box 1715
Baltimore, Maryland 21203-1715

3. **Transfer of MDSPGP-4 Verifications:** If the permittee sells the property associated with a MDSPGP-4 verification, the permittee may transfer the MDSPGP-4 verification to the new owner by submitting a letter to the Baltimore District Corps of Engineers office to validate the transfer. A copy of the MDSPGP-4 verification must be attached to the letter, and the letter must contain the following statement and signature:

"When the structures or work authorized by this MDSPGP-4 are still in existence at the time the property is transferred, the terms and conditions of this MDSPGP-4, including special conditions, will continue to be binding on the new owner(s) of the property. To validate the transfer of this MDSPGP-4 permit and the associated liabilities associated with compliance with its terms and conditions, have the transferee sign and date below."

_____ _____
(Transferee) (Date)

4. **Maintenance:** The permittee shall properly maintain the work or structure authorized by the MDSPGP-4 in good condition and in compliance with the terms and conditions of the MDSPGP-4, including maintenance to ensure public safety.

5. **Property Rights:** The MDSPGP-4 does not convey any property rights, either in real estate or material, or any exclusive privileges, nor does it authorize any injury to property or invasion of rights or any infringement of Federal, State, or local laws or regulations.

6. **Modification, Suspension and Revocation:** The MDSPGP-4, or any verification under it, may be either modified, suspended, or revoked, in whole or in part, pursuant to DA policies and procedures and any such action shall not be the basis for any claim for damages against the United States.

7. **Restoration:** The permittee, upon receipt of a notice of revocation of authorization under the MDSPGP-4, shall restore the wetland or waterway to its former condition, without expense to the United States and as directed by the Secretary of the Army or his authorized representative. If the permittee fails to comply with such a directive, the Secretary or his designee may restore the wetland or waterway to its former condition, by contract or otherwise, and recover the cost from the permittee.

8. **Special Conditions:** The Corps may impose special conditions on any project authorized under the MDSPGP-4, in cases where the Corps determines that special conditions are necessary to avoid or minimize adverse effects on the environment or on any other factor of the public interest. Failure to comply with all conditions of the authorization/ verification, including special conditions, will constitute a permit violation/unauthorized work and may subject the permittee to criminal, civil, or administrative penalties, and/or restoration.

9. **False or Incomplete Information:** In granting authorization pursuant to this permit, the Baltimore District will rely upon information and data provided by the permittee. If the project is verified by the Corps or MDE under the MDSPGP-4 and subsequently discovers that it has relied on false, incomplete, or inaccurate information provided by the permittee, the MDSPGP-4 verification may be revoked, in whole or in part, and/or the United States may institute appropriate legal proceedings.

10. **Compliance:** Any activity performed in waters of the United States, including wetlands and navigable waters, that is not in compliance with all the terms and conditions of the MDSPGP-4, which includes the MDSPGP-4 authorized activity activity-specific requirements, constitutes unauthorized work and is subject to an enforcement action by the Corps or the EPA. Furthermore, the MDSPGP-4 does not delegate any Section 404 enforcement or regulatory authority. Unauthorized work in waters of the United States, including wetlands and navigable waters, is subject to one or more of the following responses by EPA and/or the Corps:

a. A Cease and Desist order and/or an administrative compliance order requiring remedial action.

b. Initiation and assessment of a Class I administrative penalty order pursuant to Section 309(g) of the CWA.

c. Initiation and assessment of a Class II administrative penalty for continuing violation pursuant to Section 309(g) of the CWA.

d. Referral of the case to the U. S. Attorney with a recommendation for a civil or criminal action.

e. If the Corps determines that an after-the-fact application is appropriate, it will be reviewed following the appropriate procedures.

f. Any other appropriate response.

Corps Permit Tracking Number

MDSPGP-4
ACTIVITY (e-(9))
Residential, Commercial, and Institutional Development Activities

The authorized Residential, Commercial, and Institutional Development activities must comply with the following applicable activity-specific conditions indicated by an "X" in the boxes below, all general conditions of this general permit, and any project-specific special conditions.

This activity authorizes the discharges of dredged or fill material into nontidal waters of the United States associated with residential, commercial, and institutional development activities, including the construction or expansion of residential, commercial, or institutional building foundations, building pads, and attendant features that are necessary for the use and maintenance of the structures. Attendant features may include, but are not limited to, roads, parking lots, garages, yards, sidewalks, utility lines, stormwater management facilities, and recreational facilities such as playgrounds, playing fields, trails, and golf courses (provided the golf course is an integral part of the residential development). Residential developments include a single residence, multiple and single unit developments, and/or a residential subdivision. Examples of commercial developments include retail stores, industrial facilities, restaurants, business parks, and shopping centers. Examples of institutional developments include schools, libraries, hospitals, and places of worship. The construction of new golf courses (unless an integral part of a residential development), new ski areas, or oil and gas wells are not authorized by this activity (Sections 10 and 404, limited to nontidal waters of the United States, including navigable nontidal Section 10 waters, e.g., Potomac and Susquehanna Rivers, etc.).

New crossings of all waters of the United States will be reviewed based on the following order of preference: (a) bridge, (b) bottomless arch culvert, and (c) pipe or box culvert. Written documentation may be required to support the preferred crossing method.

☐ **Category A Impact Limits and Requirements:**

i. The total temporary and permanent impacts to nontidal waters of the United States, which includes nontidal wetlands, streams, rivers, navigable waters, and other open waters, are not to exceed 5,000 square feet of waters of the United States and/or 200 linear feet of nontidal streams, rivers, or other open waters.

ii. Category A does not authorize the discharge of fill into streams for the construction of berms for in-line (i.e., in-stream) stormwater management facilities, permanent dikes, dams, water withdrawals, or water diversions. It also does not authorize the construction of any kind of pond that would impound water into a stream or wetland. Category B or alternate Corps permit review procedures are required for construction of these ponds or stormwater management facilities.

iii. Limit-of-disturbance easements for the construction of utility lines within nontidal waters of the United States, including wetlands, must be limited to the minimum width necessary and not to exceed 30 feet in width.

iv. The utility line must make a direct or perpendicular crossing of any stream channel.

v. Open-cut pipeline installation within adjacent jurisdictional wetlands must not parallel a stream channel for more than 100 feet along the ordinary high water mark.

vi. The top of the cable, encasement, or pipeline shall be located a minimum of 3 feet below the existing bottom elevation of the streambed and generally does not require any riprap protection in-stream. When the utility is placed in bedrock, a minimum depth of 1 foot from the lowest point in the natural contour of the streambed shall be maintained.

vii. This Category A activity does not authorize discharges into nontidal wetlands adjacent to tidal waters. It must be reviewed under Category B or alternate Corps permit review procedures, as appropriate.

viii. Any temporary crossing that must remain in place for over one year after the installation date requires review under Category B or alternate Corps permit review procedures, as appropriate.

ix. The following conditions are applicable to Coastal Plain streams, and Harford and Cecil County Piedmont streams:

(1) Permanent culvert pipes that are greater than 24 inches in diameter and bridge/arch footers must be countersunk a minimum of 12 inches below the natural stream invert.

(2) Permanent culvert pipes and bridge/arch footers placed in streams on bedrock or over buried utility lines are exempt from these countersinking (i.e., depressing) requirements and must be constructed in accordance with the State of Maryland regulations. Permanent culvert pipes and bridge/arch footers placed in streams on bedrock or over buried utility lines are eligible for Category A review with specific documentation concerning site conditions and limitations on depressing the culvert, cost, and engineering factors that prohibit depressing the pipes/culvert.

(3) All permanent culvert pipes greater than 24 inches in diameter and bridge/arch footers (except those placed in streams on bedrock or over buried utility lines) that cannot be countersunk in accordance with condition *(1)* above are not eligible for Category A and must be reviewed under Category B or alternate Corps permit review procedures, as appropriate.

☒ **Category B Impact Limits and Requirements:**

i. The total temporary and permanent impacts to nontidal waters of the United States, which includes nontidal wetlands, streams, rivers, navigable waters, and other open waters, are not to exceed 1/2 acre (21,780 square feet) of waters of the United States and/or 2,000 linear feet of nontidal streams, rivers, or other open waters.

ii. For all submerged utility lines across navigable waters of the United States, the cross-sectional view drawing submitted with the application shall show the utility line crossing from bank to bank in relationship to the waterway bottom. In addition, the location and depth of the Federal navigation channel shall be shown in relation to the proposed utility line.

iii. The following conditions are applicable to Coastal Plain streams, and Harford and Cecil County Piedmont streams:

(1) Permanent culvert pipes that are greater than 24 inches in diameter and bridge/arch footers must be countersunk a minimum of 12 inches below the natural stream invert.

(2) Permanent culvert pipes and bridge/arch footers placed in streams on bedrock or over buried utility lines are exempt from these countersinking (i.e., depressing) requirements and must be constructed in accordance with the State of Maryland regulations.

(3) All permanent culvert pipes greater than 24 inches in diameter and bridge/arch footers placed in streams must be countersunk in accordance with condition *(1)* above (except those placed in streams on bedrock or over buried utility lines), unless the Corps and MDE waives the countersinking (i.e., depressing) requirement by making a written determination concluding that countersinking is not practicable and will result in minimal adverse effects.

(4) If countersinking of the culvert or footer is not practicable in accordance with requirement *(1)* above (except those placed in streams on bedrock or over buried utility lines), the applicant must submit a narrative, along with their application, documenting measures evaluated to minimize disruption of the movement of aquatic life, as well as specific documentation concerning site conditions and limitations on depressing the culvert/footer, cost, and engineering factors that prohibit depressing the culvert/footer. Preferred alternative options that must be considered include the use of a bridge or bottomless pipe. Other alternative options may include partial depression or other measures to provide for the movement of aquatic organisms. This documentation must also include photographs documenting site conditions. The applicant may find it helpful to contact their regional fishery agency for recommendations about the measures to be taken to allow for migratory fish passage.

☒ **Requirements Applicable to Both Category A and Category B Activities:**

i. Application must be submitted to MDE for Corps authorization.

ii. The construction of new golf courses (unless an integral part of a residential development), new ski areas, or oil and gas wells are not authorized by this activity.

iii. Impacts shall be minimized by selection of a utility alignment that avoids and minimizes wetland and waterway impacts to the maximum extent practicable. Directional drilling, jack and bore, missile, or similar methods are the preferred method of installation.

iv. Clearing of wetlands and fragmentation of large tracts of forested wetlands shall be minimized by routing utility lines outside forested tracts or on the edges of forested tracts.

v. When underground utility lines are installed in streams and wetlands, the trench cannot be constructed or backfilled in such a manner as to drain waters of the United States (e.g., backfilling with extensive gravel layers; creating a French drain effect). Clay plugs, impervious membranes, or other materials may be placed in the trenches to ensure that the trench does not drain the waters of the United States through which the utility line is installed.

vi. Utility lines installed below the plane of the ordinary high water mark of any stream or waterway shall be constructed under dry conditions, using stream diversions other than earthen cofferdams.

vii. In wetlands, the top 6 to 12 inches of the trench must be backfilled with the top 6 to 12 inches of topsoil removed from the trench.

viii. Excavated material must not be stockpiled in wetlands for longer than 14 days. Excavated material must be stabilized with straw bales, silt fence, or other erosion and sediment control measures to prevent reentry of soil into waters of the United States.

ix. Immediately after completion of construction of the utility line through the wetlands area, excess excavated material must be disposed of in an upland area and stabilized with straw bales, silt fence or other erosion and sediment control devices to prevent its reentry into waters of the United States, including wetlands.

x. Temporary fills must be removed in their entirety and the affected areas returned to pre-construction elevations and revegetated with native wetland species.

xi. Extensions of existing pipes or culverts that are not depressed below the stream invert are exempt from the requirement to depress the culvert.

xii. Any temporary road crossing must be removed within 14 calendar days after the structure is no longer needed, subject to any time of year restrictions.

xiii. Exposed slopes and stream banks must be stabilized and revegetated, preferably with native, woody species, immediately after construction of the utility line is completed.

xiv. When mechanized landclearing results in the permanent removal or conversion of a forested or scrub-shrub wetland to an herbaceous wetland in the permanently maintained utility right-of-way, compensatory mitigation is required to reduce the adverse effects of the project to the minimal level. This is in addition to the requirement to mitigate for other permanent wetland and nontidal stream impacts resulting from the discharge of dredged or fill material. Stream relocation using natural stream design is considered to be self-mitigating.

☒ **Project-Specific Special Conditions apply (See Corps verification letter for these conditions)**

MDSPGP-4 PERMIT COMPLIANCE CERTIFICATION FORM (10/1/11)

Corps Permit Tracking No. 2013-61335-M18 Category & Activity Number Cat B; Activity e(9)

Project Name AA DPW Millersville Landfill Cell 9 Applicant Name Anne Arundel County DPW

Waterway Wells Branch County Anne Arundel County

Dear Permittee:

In accordance with the compliance certification condition of your MDSPGP-4 authorization, you are required upon completion of all permitted work, or if mitigation/compensation is required, within 60 days following completion of the authorized work and any required mitigation (but not the mitigation monitoring, which requires separate submittals), to complete and sign this certification form and return it to the Corps of Engineers, Baltimore District, ATTN: CENAB-OP-R, P.O. Box 1715, Baltimore, Maryland 21203-1715.

Please note that the permitted activity is subject to compliance inspections by U.S. Army Corps of Engineers representatives. As a condition of this permit, failure to return this notification form, provide the required information below, or to perform the authorized work in compliance with the permit, can result in suspension, modification or revocation of your authorization in accordance with 33 CFR Part 325.7 and/or administrative, civil, and/or criminal penalties, in accordance with 33 CFR part 326.

Please provide the following information:

1. Date authorized work commenced: _____ 2. Date authorized work completed: _____

3. Was all work and any required mitigation, completed in accordance with your MDSPGP-4 authorization, including all general and/or specific conditions? YES___ NO ___

4. For Category A projects involving pile driving activities that are within all tidal waters of the Chesapeake Bay in Maryland and its tidal tributaries with salinity levels less than 6 parts per thousand (See Appendix B of the MDSPGP-4), please indicate the pile driving method that was used for the authorized work:

_____(a) Piles must be installed in-the-dry during low water;
_____(b) Piles must be drilled and pinned to ledge;
_____(c) Vibratory hammers must be used to install any size and quantity of wood, concrete, or steel pilings;
_____(d) Impact hammers must be limited to one hammer and <50 piles installed per day with the following: wood piles of any size; concrete piles <18-inches diameter; steel piles <12-inch diameter if the hammer is <3,000 pounds and a wood cushion is used between the hammer and steel pile;
_____(e) Approved pile driving methods that will allow noise level thresholds to be met.
Describe: _____

5. Explain in detail any deviations to the authorized work and/or mitigation (use additional sheets if necessary)

_____

_____

6. Was mitigation accomplished through a contribution to the Maryland Nontidal Wetlands Compensation Fund? YES_____NO_____ (if NO, please complete Nos. 6 and 7 below).

7. Wetland Mitigation: Required? YES____ NO_____ Required Completion Date _____
Wetland Mitigation Completed? YES_____ NO____ Mitigation Monitoring Reports Required? YES____ NO____

8. Please attach labeled photographs showing completed work including mitigation area(s).

I hereby certify that, except as noted above, that all work, including mitigation, has been completed in accordance with the terms and conditions, including special conditions of the above referenced permit.

Appendix A.8
MDE Letter of Authorization - Wetlands and Stream (2014)

STATE OF MARYLAND
DEPARTMENT OF THE ENVIRONMENT
WATER MANAGEMENT ADMINISTRATION
LETTER OF AUTHORIZATION

AUTHORIZATION NUMBER: **13-NT-0487/201362102**

EFFECTIVE DATE: June 5, 2014

EXPIRATION DATE: June 5, 2017

AUTHORIZED PERSON: **Anne Arundel County Department of Public Works**
2662 Riva Road, 3RD Floor
Annapolis, Maryland 21401
Attention: Kenneth B. Fleming, P.E.

IN ACCORDANCE WITH ENVIRONMENT ARTICLE §5-503(a) AND §5-906(b), ANNOTATED CODE OF MARYLAND (2007 REPLACEMENT VOLUME), COMAR 26.17.04 AND 26.23.01, AND 26.08.02 AND THE ATTACHED CONDITIONS OF AUTHORIZATIONS, **Anne Arundel County Department of Public Works** (AUTHORIZED PERSON"), IS HEREBY AUTHORIZED BY THE WATER MANAGEMENT ADMINISTRATION ("ADMINISTRATION") TO CONDUCT A REGULATED ACTIVITY IN A NONTIDAL WETLAND, BUFFER, OR EXPANDED BUFFER, AND/OR TO CHANGE THE COURSE, CURRENT OR CROSS-SECTION OF WATERS OF THE STATE, IN ACCORDANCE WITH THE ATTACHED PLANS APPROVED BY THE ADMINISTRATION ON **June 5, 2014** ("APPROVED PLAN") AND PREPARED BY **SCS Engineers and Vanasse Hangen Brustlin, Inc.** AND INCORPORATED HEREIN, AS DESCRIBED BELOW:

The project includes stream restoration of Wells Branch to mitigate for impacts associated with creation of Cell 9 of the Millersville Landfill. The project will temporarily impact 20,111 sq-ft of forested nontidal wetland, 30,000 sq-ft of nontidal wetland buffer and 1925 lf or 15,400 sq-ft of perennial stream. The project is located at 389 Burns Crossing Road, Severn, in Anne Arundel County.

1. **Validity:** Authorization is valid only for use by Authorized Person. Authorization may be transferred only with prior written approval of the Administration. In the event of transfer, transferee agrees to comply with all terms and conditions of Authorization.
2. **Initiation of Work, Modifications and Extension of Term**: Authorized Person shall initiate authorized activities with two (2) years of the Effective Date of this Authorization or the Authorization shall expire. Authorized Person may submit written requests to the Administration for (a) extension of the period for initiation of work, (b) modification of Authorization, including the Approved Plan, or, (c) not later than 45 days prior to Expiration Date, an extension of the term. Requests for modification shall be in accordance with applicable regulations and shall state reasons for changes, and shall indicate the impacts on nontidal wetlands, streams, and the floodplain, as applicable. The Administration may grant a request at its sole discretion.
3. **Responsibility and Compliance**: Authorized Person is fully responsible for all work performed and activities authorized by this Authorization shall be performed in compliance with this Authorization and Approved Plan. Authorized Person agrees that a copy of the Authorization and Approved Plan shall be kept at the construction site and provided to its employees, agents and contractors. A person (including Authorized Person, its employees, agents or contractors) who violates or fails to comply with the terms and conditions of this Authorization, Approved Plan or an administrative order may be subject to penalties in accordance with §5-514 and §5-911, Department of the Environment Article, Annotated Code of Maryland (2007 Replacement Volume).
4. **Failure to Comply**: If Authorized Person, its employees, agents or contractors fail to comply with this Authorization or Approved Plan, the Administration may, in its discretion, issue an administrative order requiring Authorized Person, its employees, agents and contractors to cease and desist any activities which violate this Authorization, or the Administration may take any other enforcement action available to it by law, including filing civil or criminal charges.
5. **Suspension or Revocation**: Authorization may be suspended or revoked by the Administration, after notice of opportunity for a hearing, if Authorized Person: (a) submits false or inaccurate information in Permit application or subsequently required submittals; (b) deviates from the Approved Plan, specifications, terms and conditions; (c) violates, or is about to violate terms and conditions of this Authorization; (d) violates, or is about to violate, any regulation promulgated pursuant to Title 5, Department of the Environment Article, Annotated Code of Maryland as amended; (e) fails to allow authorized representatives of the Administration to enter the site of authorized activities at any reasonable time to conduct inspections and evaluations; (f) fails to comply with the requirements of an administrative action or order issued by the Administration; or (g) does not have vested rights under this Authorization and new information, changes in site conditions, or amended regulatory requirements necessitate revocation or suspension.
6. **Other Approvals**: Authorization does not authorize any injury to private property, any invasion of rights, or any infringement of federal, State or local laws or regulations, nor does it obviate the need to obtain required authorizations or approvals from other State, federal or local agencies as required by law.
7. **Site Access:** Authorized Person shall allow authorized representatives of the Administration access to the site of authorized activities during normal business hours to conduct inspections and evaluations necessary to assure compliance with this Authorization. Authorized Person shall provide necessary assistance to effectively and safely conduct such inspections and evaluations.
8. **Inspection Notification:** Authorized Person shall notify the Administration's Compliance Program at least five (5) days before starting authorized activities and five (5) days after completion. For Allegany, Garrett, and Washington Counties, Authorized Person shall call 301-689-1480. For Carroll, Frederick, Howard, Montgomery and Prince George's Counties, Authorized Person shall call 301-665-2850. For Baltimore City, Anne Arundel, Baltimore, Calvert, Charles, and St. Mary's Counties, Authorized Person shall call 410-537-3510. For Caroline, Cecil, Dorchester, Harford, Kent, Queen Anne's, Somerset, Talbot, Wicomico and Worcester Counties, Authorized Person shall call 410-901-4020. If Authorization is for a project that is part of a mining site, please contact the Land Management Administration's Mining Program at 410-537-3557 at least five (5) days before starting authorized activities and five (5) days after completion.
9. **Sediment Control:** Authorized Person shall obtain approval from the **Anne Arundel** County Soil Conservation District for a grading and sediment control plan specifying soil erosion control measures. The approved grading and sediment control plan shall be included in the Approved Plan, and shall be available at the construction site.
10. **Federally Mandated State Authorizations:**
    X **Water Quality Certification**: Water Quality Certification is granted for this project provided that all work is performed in accordance with the authorized project description and associated conditions.
    X **Coastal Zone Consistency:** This Authorization constitutes official notification that authorized activities are consistent with the Maryland Coastal Zone Management Program, as required by Section 307 of the Federal Coastal Zone Management Act of 1972, as amended. Activities within the following counties are not subject to this requirement:
    Allegany, Carroll, Frederick, Garrett, Howard, Montgomery, and Washington.

11. **Best Management Practices During Construction:** Authorized Person, its employees, agents and contractors shall conduct authorized activities in a manner consistent with the Best Management Practices specified by the Administration.
12. **Disposal of Excess:** Unless otherwise shown on the Approved Plan, all excess fill, spoil material, debris, and construction material shall be disposed of outside of nontidal wetlands, nontidal wetlands buffers, and the 100-year floodplain, and in a location and manner which does not adversely impact surface or subsurface water flow into or out of nontidal wetlands.
13. **Temporary Staging Areas:** Temporary construction trailers or structures, staging areas and stockpiles shall not be located within nontidal wetlands, nontidal wetlands buffers, or the 100-year floodplain unless specifically included on the Approved Plan.
14. **Temporary Stream Access Crossings:** Temporary stream access crossings shall not be constructed or utilized unless shown on the Approved Plan. If temporary stream access crossings are determined necessary prior to initiation of work or at any time during construction, Authorized Person, its employees, agents or contractors shall submit a written request to the Administration and secure the necessary permits or approvals for such crossings before installation of the crossings. Temporary stream access crossings shall be removed and the disturbance stabilized prior to completion of authorized activity or within one (1) year of installation.
15. **Discharge:** Runoff or accumulated water containing sediment or other suspended materials shall not be discharged into waters of the State unless treated by an approved sediment control device or structure.
16. **Instream Construction Prohibition:** To protect important aquatic species, motor driven construction equipment shall not be allowed within stream channels unless on authorized ford crossings. Activities within stream channels are prohibited as determined by the classification of the stream (COMAR 26.08.02.08): **Wells Branch** is a **Use I** waterway; in-stream work may not be conducted from **March 1st** through **June 15th**, inclusive, of any year.
17. **Instream Blasting:** Authorized Person shall obtain prior written approval from the Administration before blasting or using explosives in the stream channel.
18. **Minimum Disturbance:** Any disturbance of stream banks, channel bottom, wetlands, and wetlands buffer authorized by this Authorization or Approved Plan shall be the minimum necessary to conduct permitted activities. All disturbed areas shall be stabilized vegetatively no later than seven (7) days after construction is completed or in accordance with the approved grading or sediment and erosion control plan.
19. **Restoration of Construction Site:** Authorized Person shall restore the construction site upon completion of authorized activities. Undercutting, meandering or degradation of the stream banks or channel bottom, any deposition of sediment or other materials, and any alteration of wetland vegetation, soils, or hydrology, resulting directly or indirectly from construction or authorized activities, shall be corrected by Authorized Person as directed by the Administration.

U.S. ARMY CORPS OF ENGINEERS AUTHORIZATION

The U.S. Army Corps of Engineers has reviewed this activity and has granted authorization under an Individual Permit. The terms and conditions of the Individual Permit, as sent to the applicant directly from USACE, should be followed when performing the authorized work.

BEST MANAGEMENT PRACTICES FOR WORKING IN NONTIDAL WETLANDS, WETLAND BUFFERS, WATERWAYS, AND 100-YEAR FLOODPLAINS

1) No excess fill, construction material, or debris shall be stockpiled or stored in nontidal wetlands, nontidal wetland buffers, waterways, or the 100-year floodplain.
2) Place materials in a location and manner which does not adversely impact surface or subsurface water flow into or out of nontidal wetlands, nontidal wetland buffers, waterways, or the 100-year floodplain.
3) Do not use the excavated material as backfill if it contains waste metal products, unsightly debris, toxic material, or any other deleterious substance. If additional backfill is required, use clean material free of waste metal products, unsightly debris, toxic material, or any other deleterious substance.
4) Place heavy equipment on mats or suitably operate the equipment to prevent damage to nontidal wetlands, nontidal wetland buffers, waterways, or the 100-year floodplain.
5) Repair and maintain any serviceable structure or fill so there is no permanent loss of nontidal wetlands, nontidal wetland buffers, or waterways, or permanent modification of the 100-year floodplain in excess of that lost under the originally authorized structure or fill.
6) Rectify any nontidal wetlands, wetland buffers, waterways, or 100-year floodplain temporarily impacted by any construction.
7) All stabilization in the nontidal wetland and nontidal wetland buffer shall consist of the following species: Annual Ryegrass (Lolium multiflorum), Millet (Setaria italica), Barley (Hordeum sp.), Oats (Uniola sp.), and/or Rye (Secale cereale). These species will allow for the stabilization of the site while also allowing for the voluntary revegetation of natural wetland species. Other non-persistent vegetation may be acceptable, but must be approved by the Nontidal Wetlands and Waterways Division. **Kentucky 31 fescue shall not be utilized in wetland or buffer areas.** The area should be seeded and mulched to reduce erosion after construction activities have been completed.
8) After installation has been completed, make post-construction grades and elevations the same as the original grades and elevations in temporarily impacted areas.
9) To protect aquatic species, in-stream work is prohibited as determined by the classification of the stream:

   Use I waters: In-stream work shall not be conducted during the period March 1 through June 15, inclusive, during any year.

10) Stormwater runoff from impervious surfaces shall be controlled to prevent the washing of debris into the waterway.
11) Culverts shall be constructed and any riprap placed so as not to obstruct the movement of aquatic species, unless the purpose of the activity is to impound water.

KEY TO SYMBOLS

Symbol Description

Strata symbols

Silty sand

Poorly graded sand with silt

Silt

Poorly graded sand

Low plasticity clay

Misc. Symbols

Water table at 24 hrs.

C Depth to caving

Soil Samplers

Standard penetration test

Notes:

1. Borings were completed on 08/25/11, 08/26/11, and 08/29/11.

2. Water readings are listed on logs.

REMARKS

CH = Fat Clay
CS = Sandy Clay
SC = Clayey Sand
SP = Poorly Graded Sand
SW = Well Graded Sand

Borehole drilled using 8" bit to a depth of 184' below grade. Well installed to a depth of 170' below grade using 20' of screen. Samples collected every 10'.

Well development was conducted on the following dates and times via the air jetting method with the following observances:
07-21-16, 8:05-8:50: dark red and turbid. 8:50-11:00: clearing up, less red; 11:00-12:00: mostly clear, slightly cloudy, no color, no sand; 12:00-12:05: clear, no sand, no color.
07-22-16, Well development performed for 2 hours by A.C. Schultes, not overseen by SCS.

WELL COMPLETION REPORT

FILL IN THIS FORM COMPLETELY

DATE RECEIVED (WRA USE ONLY): 03 04 75

DATE WELL COMPLETED: FEB. 5, 1975 — 04 15 75

DEPTH OF WELL (TO NEAREST FOOT): 260

PERMIT NO. FROM "PERMIT TO DRILL WELL": AA-173-3663

DRILLER'S IDENTIFICATION NO.: 26

MW-MB

OWNER: Anne Arundel County

STREET OR RFD: Millersville Sanitary Landfill — POST OFFICE: Gambrills, Md.

WELL LOG

STATE THE KIND OF FORMATIONS PENETRATED, THEIR COLOR, DEPTH, THICKNESS AND IF WATER BEARING

DESCRIPTION (USE ADDITIONAL SHEETS IF NECESSARY)	FEET FROM	FEET TO	CHECK IF WATER BEARING
Med. course brown sand	0	15	
med. course white sand	15	31	
med. course yellow sand	31	38	
fine yellow sand (silty)	38	54	
course tan sand	54	69	
gr. tan sand & streaks white clay	69	83	
white clay	83	94	
red clay	94	108	
pea gravel	108	123	
fine tan sand	123	140	
red & white clay mixed	140	154	
fine tan sand	154	169	
med. course to fine sand	169	189	
red clay	189	196	
sand & gravel	196	201	x
med. course sand, gravel & few streaks white clay	201	229	
clay	229	238	
white clay	238	248	
gravel	248	259	x

GROUTING RECORD

WELL HAS BEEN GROUTED (CIRCLE APPROPRIATE BOX): YES / NO

TYPE OF GROUTING MATERIAL (CIRCLE BOX): CEMENT (C M) — BENTONITE CLAY (B C)

NO. OF BAGS: 40 — NO. OF POUNDS: 3760

GALLONS OF WATER: 200

DEPTH OF GROUT SEAL (TO NEAREST FOOT): FROM 0 FT. TO 80 FT. (ENTER 0 IF FROM SURFACE)

CASING RECORD

CASING TYPES (INSERT APPROPRIATE CODE BELOW): STEEL (S T) — CONCRETE (C O) — PLASTIC (P L) — OTHER (O T)

MAIN CASING TYPE	NOMINAL DIAMETER TOP MAIN CASING (NEAREST INCH)	TOTAL DEPTH OF MAIN CASING (NEAREST FOOT)
S S	6	221

OTHER CASING (IF USED)

Baltimore, MD 21230-1720

RE: Semi-Annual Groundwater and Surface Water Reports, January 1 – June 30, 2021, Millersville Landfill and Resource Recovery Facility and Sudley Closed Landfill

Dear Mr. Grenzer:

Enclosed are the Semi-Annual Groundwater and Surface Water Data Evaluation Reports for the Millersville Landfill and Resource Recovery Facility and the Sudley Landfill. The analytical results (raw data reports) for the monitoring events are also enclosed. The text, tables, and appendices are included as hard copies. The appendix containing the raw analytical data results is included electronically on the accompanying CDs.

Should you have any questions regarding the information covered in this document, please contact me or Mark Morris on (410) 222-6108.

Sincerely,

Stephen J. Krajcsik
Solid Waste Operations Administrator

EXECUTIVE SUMMARY

The Maryland Department of Environment (MDE) has developed groundwater and surface water monitoring requirements to detect pollutant releases from landfills that could have adverse impacts on public health and the environment. To fulfill these requirements, landfills must be monitored to address three issues: (i) whether a release of chemicals from the landfill has occurred; (ii) whether conditions potentially adverse to public health and the environment were created as a result of a release; and (iii) whether the results of a statistical evaluation of groundwater data require that additional sampling and/or corrective measures be implemented. This executive summary presents the findings of the 1st semi-annual 2021 (Spring 2021) groundwater sampling event, performed at the Millersville Landfill and Resource Recovery Facility (MLFRRF) located in Anne Arundel County. The findings are summarized with respect to these three issues.

The sampling results are evaluated for compliance with regulatory standards, including: (i) U.S. Environmental Protection Agency (USEPA) maximum contaminant levels (MCLs) and secondary maximum contaminant levels (SMCLs); (ii) Maryland health-based standards; and (iii) groundwater protection standards (GWPS) established for the site. MCLs and groundwater protection standards are established based on health concerns, whereas SMCLs are based on aesthetic concerns, such as taste, color, and odor.

The groundwater and surface water monitoring strategy for the MLFRRF was first identified in the Environmental Monitoring Plan (EMP), prepared for the Anne Arundel County Department of Public Works (the County) by Stearns & Wheeler [June 1995, Revised June 1996]. An updated EMP for MLFRRF prepared by ERM, dated November 5, 2002, was conditionally approved by MDE with their June 7, 2004 letter, contingent upon the County adding methyl tertiary butyl ether (MTBE) analysis to the monitoring program. The EMP was updated by ERM and approved by MDE in a letter dated March 25, 2010. The EMP defines two separate portions of the MLFRRF. Closed portions (Cells 1 East, 2, and 4) that stopped receiving waste prior to October 9, 1991, are subject to the requirements of the Code of Maryland (COMAR). The closed portions (Cells 5, 6, and 7) that stopped receiving waste prior to October 9, 1993, are subject to the provisions of 40 CFR Part 258 related to final cover requirements only. The recently-closed Cell 8 and currently active Cell 9 are subject to 40 CFR Part 258. However, for the purposes of monitoring, the closed portion (Cells 5, 6, and 7) are included in the monitoring and analysis requirements pursuant to 40 CFR Part 258 along with Cell 8 and Cell 9. Each of these portions of the MLFRRF are monitored by a comprehensive monitoring network, on-site regulated monitoring wells (Subtitle D), on-site regulated monitoring wells (COMAR), on-site non-regulated monitoring wells, off-site non-regulated monitoring wells, and other off-site monitoring locations. The monitoring networks were defined according to strategies that comply with the applicable regulatory requirements.

At the request of MDE, additional monitoring was performed for a select list of parameters from the Appendix II list in 40 CFR Part 258 for the on-site Subtitle D regulated monitoring wells.

OVERVIEW OF FINDINGS

Overall, the sampling event did not reveal substantial changes in groundwater quality and the results for inorganic parameters are consistent with historical results. Given the data for the MLFRRF, the site-specific hydrogeology, and the corrective actions implemented by the County, the potential for adverse effects to human health and the environment continues to be minimal.

Of all samples collected for the Spring 2021 sampling event, there were four MCL exceedances, shown on **Table 3.** One of these was a first-time MCL exceedance, that of the concentration of thallium in well TW-13. It should be noted that the thallium analysis was performed using EPA Method 6010 rather than Method 6020 as specified in the EMP. However, a confirmation sample was collected in which the concentration of thallium was measured to be below the MCL. All four MCL exceedances are discussed below in **Section 3.3.1**.

The groundwater elevations and flow directions observed in the Zone 3 aquifer during this sampling event are generally consistent with historical data and seasonal variations.

The following summarizes the results of the Spring 2021 groundwater sampling event.

On-Site Regulated Monitoring Wells (Subtitle D)

All of the Appendix I VOC detections above the reporting limit (RL) are listed in **Table 4.** The Appendix II VOC detections are listed in **Table 5**. The concentration of methylene chloride in TW-25A exceeded its applicable MCL, as is typical. There were no first-time MCL or GWPS exceedances.

In general, concentrations of Appendix I and Appendix II VOCs in the on-site Subtitle D regulated wells are consistent with historical concentrations. All VOC results for Subtitle D wells are discussed below in **Section 3.3.2**.

While iron and manganese continue to exceed SMCLs and pH is below the SMCL range in several wells, concentrations are generally consistent with historical levels.

On-site Regulated Monitoring Wells (COMAR)

Detections of Appendix I VOCs above the RL in COMAR wells are listed in **Table 6.** Appendix II VOC detections above the RL are typically listed in **Table 7;** however, there were no detections above the RL during the Spring 2021 sampling event**.** There were no GWPS or MCL exceedances for VOCs. The concentrations measured for Appendix I VOCs in the on-site COMAR-regulated wells are generally consistent with historical records.

While iron and manganese continue to exceed SMCLs and pH is below the SMCL range in several wells, concentrations are generally consistent with historical levels.

On-site Non-regulated Monitoring Wells

Appendix I VOC detections above the RL are listed in **Table 8.** Appendix II VOC detections above the RL are typically listed in **Table 9;** however, there were no detections of any Appendix II VOCs in on-site non-regulated wells during this sampling event**.** There was one MCL exceedance for VOCs—the concentration of trichloroethene (TCE) exceeded its MCL in well TW-13, as has been observed during previous events. The concentrations measured for Appendix I VOCs in the on-site non-regulated wells are generally consistent with historical records.

While iron and manganese continue to exceed SMCLs and pH is below the SMCL range in several wells, concentrations are generally consistent with historical levels. Concentrations of inorganic parameters measured in on-site non-regulated monitoring wells during the Spring 2021 sampling event—including those of iron, manganese, and pH—are generally consistent with the historical record. The only exception is the aforementioned MCL exceedance for thallium in well TW-13, which was not repeated in the subsequent confirmation sample.

Off-site Non-regulated Monitoring Wells

Appendix I VOC detections above the RL are listed in **Table 10.** Appendix II VOC detections above the RL are listed in **Table 11.** There were no MCL or GWPS exceedances. Appendix I and Appendix II VOC concentrations in these wells are generally consistent with historical concentrations. Mercury concentrations in the off-site non-regulated monitoring wells are generally consistent with the historical record.

Off-site Residential Zone 4 Water Supply Wells

As shown on **Table 12** and **Table 13**, there were no Zone 4 residential water supply wells sampled during the Spring 2021 event.

Surface Water Sampling Locations

Appendix I VOC detections above the RL are typically listed in **Table 14,** but there were no detections above the RL during the Spring 2021 sampling event**.** Appendix II VOC detections above the RL are typically listed in **Table 15**, but there were no detections above the RL at surface water locations during this sampling event. As such, there were no MCL or GWPS exceedances.

Concentrations of inorganic parameters were generally consistent with the historical record for surface water sampling locations.

Statistical Evaluation

The results of the statistical evaluation of the Spring 2021 groundwater data are generally consistent with historical results. The findings indicate that downgradient samples show constituent

concentrations that are statistically significant increases (SSIs) above background levels for several VOCs and inorganic parameters. There were two new SSIs for parameters detected above the RL during the Spring 2021 sampling event that were not identified during the Fall 2020 event. These new SSIs consist of 1,4-dichlorobenzene in TW-25A and pH in TW-02A. Concentrations of most parameters that exhibited SSIs have generally been consistent with their historical data set; that is, no trend is apparent in the concentrations.

1 INTRODUCTION

1.1 BACKGROUND

In accordance with the requirements of the Solid Waste Management Regulations provided in Title 40 of the Code of Federal Regulations, Part 258 (40 CFR Part 258) and the Maryland Department of the Environment (MDE), the Anne Arundel County Department of Public Works (County) monitors groundwater and surface water at the Millersville Landfill and Resource Recovery Facility (MLFRRF), located in Anne Arundel County, Maryland. The monitoring requirements are provided in the Environmental Monitoring Plan (EMP), prepared by Stearns & Wheeler [June 1995, Revised June 1996]. An updated EMP for MLFRRF prepared by ERM, dated November 5, 2002, was conditionally approved by MDE with their June 7, 2004 letter, contingent upon the County adding methyl tertiary butyl ether (MTBE) analysis to the monitoring program. The EMP was revised by ERM and approved by MDE in a letter dated March 25, 2010. The primary objectives of the compliance monitoring program for the MLFRRF are: (i) to determine if leachate from the landfill affects groundwater quality; (ii) to evaluate whether or not conditions that are potentially adverse to public health and the environment have been caused in groundwater or surface water by the operation of the landfill; and (iii) to determine whether the results of a statistical evaluation of the sampling data indicate that the County needs to perform additional groundwater sampling or implement corrective measures.

This semi-annual report summarizes the findings of the evaluation performed on the data obtained during the Spring 2021 groundwater sampling event. The sampling performed during this event was conducted to fulfill the monitoring requirements of 40 CFR Part 258 and the approved EMP. This report also provides an overview of groundwater quality based on current and historical data.

The sampling data were evaluated through: (i) data validation; (ii) an evaluation of the ion balances of the samples that were collected, and an evaluation of the relative percent differences (RPDs) between sampling locations and corresponding duplicates (**Appendix D**); (iii) a statistical comparison of laboratory data between designated upgradient and downgradient groundwater on-site Subtitle D regulated monitoring wells; (iv) a comparison of laboratory results for each groundwater monitoring well with historical groundwater quality information; and (v) a comparison of laboratory results for each groundwater monitoring well with United States Environmental Protection Agency (USEPA) and MDE regulatory criteria, as well as with site-specific groundwater protection standards (GWPS).

There are three sets of rules that govern how the MLFRRF monitoring data are evaluated: 40 CFR Part 258 regulations apply to those portions of the MLFRRF that continued to receive waste after October 9th, 1993; 40 CFR Part 258 regulations related to final cover requirements apply to those portions of the MLFRRF that stopped receiving waste prior to October 9, 1993; and State Code of Maryland (COMAR) regulations apply to those closed portions of the MLFRRF that stopped

receiving waste before October 9, 1991. Closed disposal Cells 1 East, 2, and 4 are monitored in compliance with COMAR standards. The closed Cells 5, 6, and 7 that stopped receiving waste prior to October 9, 1993, are subject to the provisions of 40 CFR Part 258 related to final cover requirements only. Recently-closed Cell 8 and currently active Cell 9 are subject to 40 CFR Part 258. However, for the purposes of monitoring, the closed Cells 5, 6, and 7 are included in the monitoring and analysis requirements pursuant to 40 CFR Part 258 along with Cell 8 and Cell 9.

Table 1 provides a summary of the groundwater monitoring network for the MLFRRF. As shown in **Table 1**, the wells are designated according to whether they are used to monitor the older (Cells 1 East, 2, and 4) or newer (combined Cells 5, 6, and 7, Cell 8, and Cell 9) portions of the MLFRRF. The groundwater and surface water monitoring network for the MLFRRF is illustrated in **Figure C-1** in **Appendix C**. In general, the older and newer portions are separated by the Baltimore Gas Electric right-of-way.

In accordance with the EMP and in conformance with applicable regulations, 22 of the 50 on-site monitoring wells at the MLFRRF are classified as on-site regulated monitoring wells (Subtitle D). Eleven are located along the Eastern Boundary, two are near Cell 8, two are near the facility entrance serving as background wells, and seven are near Cell 9. Additionally, another 15 of the 50 on-site monitoring wells are classified as on-site regulated monitoring wells (COMAR). These monitoring wells are governed by COMAR for the closed portion of the MLFRRF. One monitoring well, TW-26R, is regulated by the facility's refuse disposal permit and is not covered by this semi-annual report. The remaining 13 on-site monitoring wells are classified as non-regulated. In conjunction with the regulated wells, numerous off-site monitoring locations have been established by the County to take proactive measures that comply with 40 CFR Part 258 groundwater monitoring requirements.

The regulated monitoring wells (Subtitle D) consist of the wells at the site that provide information on the quality of groundwater passing the relevant point of compliance and that are downgradient of combined Cells 5, 6, and 7, Cell 8 and Cell 9. **Table 1** summarizes the sampling locations used to monitor these cells. The on-site monitoring wells are designated as "TW". Wells designated as "MW" are off-site monitoring wells installed by the County to monitor off-site chemical concentrations in the groundwater. Wells designated as "RW" are also off-site monitoring wells and were converted from drinking water supply wells to monitoring wells by the County. Off-site residential water supply wells drilled into either the Zone 3 or Zone 4 aquifer are designated by the County parcel number with the prefix "P". Off-site residential water supply wells which have been drilled into the Zone 4 aquifer by the County have the suffix "Z4". Zone 4 residential wells are sampled biennially, with the exception of well P-417-Z4. This well is sampled annually as a conservative measure because there is no sentry monitoring point between the landfill and Parcel 417. **Table 2** lists the residential water supply wells. The residential water supply wells were not sampled during the Spring 2021 sampling event.

Regulated monitoring well (Subtitle D) TW-20 was abandoned on April 8, 2010, by a licensed well driller in accordance with COMAR 26.04.04.11. The well was placed to monitor groundwater downgradient of Cell 8 but was placed where a stormwater management pond was designated for Cell 9. Zone 3 monitoring well TW-20R was installed February 3-5, 2010, adjacent to Cell 8 as a replacement for abandoned monitoring well TW-20 per the approved EMP.

In addition to TW-20R, two non-regulated on-site Zone 4 monitoring wells were installed prior to the Spring 2010 sampling event. The installation of non-regulated on-site Zone 4 monitoring wells TW-14B and TW-6B were completed per the approved EMP on January 21, 2010 and February 2, 2010, respectively.

In accordance with the EMP, four on-site Zone 3 monitoring wells, TW-27, TW-28, TW-29, and TW-30, were installed prior to the Spring 2013 sampling event for incorporation into the regulatory monitoring well network for Cell 9. Additionally, existing monitoring wells TW-01, TW-02A, and TW-03, located south of Cell 9, are now considered part of the regulatory monitoring well network. Two years of background monitoring were completed prior to Cell 9 becoming operational in January 2017.

During the Fall 2020, construction activity for Cell 9 of the landfill involved significant earthwork in the immediate vicinity of TW-28, including raising the ground surface by 10-12 feet. As a result, new sections of well pipe were added to the top of TW-28 in order to vertically extend the well.

1.2 GROUNDWATER SAMPLING AND LABORATORY ANALYSIS

1.2.1 Groundwater Sampling

The County contracted with Environmental Monitoring and Assessment, LLC (EMA) of Lititz, Pennsylvania, to conduct the semi-annual groundwater sampling at the MLFRRF for the Spring 2021 sampling event. The sampling event included the collection of samples from 22 regulated on-site monitoring wells (Subtitle D), 15 regulated on-site monitoring wells (COMAR), 13 on-site non-regulated monitoring wells, and 12 off-site monitoring wells. The sampling locations are listed in **Table 1.**

Prior to collecting the groundwater samples, the depth to the water table was measured at each well. Once the water table measurement was recorded, the monitoring wells were purged and sampled in accordance with 40 CFR Part 258, MDE requirements, and the EMP. As the monitoring wells were purged, measurements of groundwater dissolved oxygen, pH, conductivity, temperature, oxidation-reduction potential, turbidity, and appearance were recorded.

1.2.2 Groundwater Sample Analysis

The groundwater analytical program for the MLFRRF includes the analysis of samples for parameters used to monitor both the existing and closed portion of the MLFRRF. For the purpose of uniformity and ease of implementation, the samples that are collected from the wells used to monitor the closed portion of the MLFRRF are analyzed in accordance with the detection monitoring requirements (defined by 40 CFR Part 258) for the existing portion of the MLFRRF, as specified in the EMP. In accordance with these detection monitoring requirements, the samples are analyzed for the parameters listed in Appendix I of 40 CFR Part 258 (Appendix I parameters). The Appendix I parameters include inorganic constituents (metals) and organic constituents (volatile organic compounds or VOCs).

In addition to these analytical requirements, the samples collected at the site are also analyzed for parameters historically monitored at the site. These parameters include dichlorodifluoromethane and dichlorofluoromethane, which are listed in Appendix II of 40 CFR Part 258 (Appendix II parameters), methyl tertiary butyl ether (MTBE), and general chemistry parameters such as chloride and total dissolved solids that can sometimes be indicators of landfill leachate (indicator parameters).

In accordance with this analytical program described above, the groundwater samples were analyzed for VOCs, total and dissolved metals, and general chemistry indicator parameters. The methods used to analyze the samples included USEPA Methods 524.2 and 8260 for VOCs; USEPA Methods 6010 and 7470A for metals; and 40 CFR Part 136 methods for the indicator parameters. The full laboratory analytical results and data packages are presented as **Appendix E.**

1.3 SURFACE WATER SAMPLING AND LABORATORY ANALYSIS

1.3.1 Surface Water Sampling

During the Spring 2021 sampling event, three surface water samples, SW-1, SW-2, and SW-3 were collected by EMA from Wells Branch, which flows west to east across the site (see Figure C-1). The surface water samples were collected from the stream locations that are representative of upgradient and downgradient conditions. Sample location SW-1 is an upgradient location between Cell 8 and the leachate pretreatment plant, approximately 200 feet downgradient of monitoring well TW-10A. Sample location SW-2 is a downgradient location near the TW-4 well cluster. Surface water collected at this location is representative of surface water conditions prior to discharging off-site. Sample location SW-3 is a mid-stream location that is downgradient of Stormwater Pond 8-1 and is located between combined Cells 5-7, Cell 8, and Cell 9. This location is approximately equal distance from sample locations SW-1 and SW-2.

1.3.2 Surface Water Sample Analysis

The surface water samples were analyzed for VOCs, total metals, and indicator parameters. The methods used to analyze the samples included USEPA Method 8260 for VOCs; USEPA Methods 6010 and 7470A for metals; and 40 CFR Part 136 methods for the indicator parameters.

1.4 QUALITY ASSURANCE/QUALITY CONTROL SAMPLING AND ANALYSIS

1.4.1 Quality Assurance/Quality Control Sampling (QA/QC)

Field and laboratory QA/QC protocols were employed during the sampling event to ensure that QA/QC criteria were met. The field QA/QC protocols included the collection and analysis of two blind duplicate samples from wells TW-24A and TW-25. In addition, one field blank and seven trip blanks were prepared and analyzed. The laboratory QA/QC protocols included the analysis of method blanks and matrix spike (MS) and matrix spike duplicate (MSD) samples for GC/MS runs. These protocols help identify possible sources of VOC contamination that may cause elevated or false positive parameter levels to be reported.

1.4.2 Quality Assurance/Quality Control Sample Analysis

To ensure that the field QC criteria were met, blind duplicate samples were analyzed for all parameters for which the groundwater samples were analyzed. These parameters include VOCs by USEPA Method 8260; total and dissolved metals by USEPA Methods 6010 and 7470A; and the indicator parameters by 40 CFR Part 136 methods. The field blank was also analyzed for all parameters for which the Subtitle D regulated monitoring wells were analyzed. These parameters include VOCs by USEPA Method 8260; total and dissolved metals by USEPA Methods 6010 and 7470A; and indicator parameters by 40 CFR Part 136 methods. The trip blanks were analyzed for VOCs according to USEPA Method 8260.

To ensure that the laboratory QA criteria were met, project-specific MS and MSD samples were analyzed at the rate of one MS/MSD sample for every 20 field samples, as specified in the EMP. The MS and MSD samples were used by the laboratory to evaluate possible matrix effects that could have interfered with the analytical method, and to estimate the method precision. The analysis of laboratory method blanks was performed to identify possible sources of contamination that may have caused elevated or false positive parameter levels to be reported.

1.5 DATA ANALYSIS METHODOLOGY

The analysis of the data obtained during this sampling event included: validation of the laboratory data, determination of USEPA National Primary Drinking Water Standards (MCLs) exceedances,

statistical evaluation of upgradient versus downgradient parameter concentrations, identification of GWPS exceedances, and assessment of groundwater elevations.

The laboratory sample data and QA/QC data were validated to verify proper analytical procedures and checks were performed by the analytical laboratory. The laboratory data validation is discussed further in **Appendix D** of this report. The laboratory analytical data packages are presented as **Appendix E** of this report.

The data were evaluated to determine whether or not concentrations exceeded MCLs and National Secondary Drinking Water Standards (SMCLs), state health-based standards, and site-specific GWPS. The GWPS for the site were established in 1997. This evaluation is included in **Section 3** of this report.

The data analysis included a statistical evaluation of the detection monitoring data obtained from the on-site regulated monitoring wells (Subtitle D). This evaluation was used to determine if there is a statistically significant change in groundwater quality for the portions of the site subject to 40 CFR Part 258.54 that may be attributed to the MLFRRF. The historical concentrations of the parameters detected in the groundwater samples from each on-site regulated monitoring well (Subtitle D) were compared to the historical background data using statistical methods described in the EMP and 40 CFR Part 258.53(g). The statistical analysis is discussed further in **Section 4** of this report.

2 SUMMARY OF SAMPLING EVENT

2.1 OVERVIEW

The County contracted with EMA to conduct the Spring 2021 sampling event at the MLFRRF. Laboratory sample analysis was performed by Pace Analytical Service (Pace), of Greensburg, Pennsylvania.

The groundwater monitoring wells were purged and sampled in accordance with the EMP and 40 CFR Part 258. **Figure C-1** shows the locations of the sampling points and the corresponding sampling classifications. Quality control blanks and blind duplicates were obtained, as discussed in **Section 1.4.1** of this report. The groundwater samples were submitted to the laboratory for analyses of total and specific dissolved metals, Appendix I VOCs, and inorganic indicators of leachate (chloride, ammonia, nitrite and nitrate-nitrogen, chemical oxygen demand, total alkalinity, sulfate, dissolved solids, and hardness).

2.2 DATA ANALYSIS

The methods used to collect and analyze the groundwater, surface water and QA/QC samples for this sampling event were evaluated to determine compliance with the EMP for the site and 40 CFR Part 258. The following procedures were followed to evaluate the compliance of the field sampling activities and the laboratory methods:

- Review of the appropriateness of the analytical methods;
- Review of the appropriateness of sample bottle types, preservatives, and holding times for each analytical method;
- Review of reports and analytical data for trip blanks, field blanks, duplicate samples, and laboratory method blanks to identify possible evidence of contamination;
- Review of Chain-of-Custody documentation for accuracy and completeness; and
- Review of field methods described in the field sampling reports.

The field and laboratory results were also evaluated to determine the validity of the data. The following procedures were followed to assess the validity of the data:

- Calculation of charge balance errors on the samples collected in the field;
- Review of MS and MSD samples to evaluate possible matrix effects that may interfere with the analytical method;

- Review of MS, MSD, and blind duplicate samples to calculate the relative percent difference (RPD) of duplicate samples in obtaining an estimate of laboratory method precision;

- Review of laboratory reports on instrument tuning, instrument calibration, and recoveries of spiked samples for each analytical method; and

- Comparison of the analytical data and groundwater elevations to historical values at each sampling location.

The results obtained from this evaluation satisfy the project QA/QC objectives. The results of the evaluation of the analytical data are provided in **Appendix D.** The full laboratory analytical data packages are presented as **Appendix E** of this report.

A comparison of the analytical data to MCLs, SMCLs, State standards, and established GWPS, as well as to historical data, is discussed in **Section 3.**

3 SUMMARY OF ANALYTICAL RESULTS

3.1 INTRODUCTION

Groundwater elevations were measured by the County on a monthly basis and are included in this report in **Appendix C**. The field and laboratory analytical results were evaluated by comparing the current data to historical data. The laboratory results were also evaluated for compliance with regulatory standards. In assessing the laboratory data, each parameter was evaluated for compliance with: (i) MCLs and SMCLs; (ii) Maryland health-based standards; and (iii) GWPS established for the site. MCLs and GWPS are established based on health concerns, whereas SMCLs are based on aesthetic concerns, such as taste, color, and odor. A statistical evaluation of the laboratory results is presented in **Section 4**.

3.2 GROUNDWATER ELEVATION DATA

The monthly water table measurements recorded during April 2021 are provided in **Appendix C.** The groundwater elevations are generally consistent with historical data.

Potentiometric surface contours for groundwater levels measured in wells screened within the Zone 3 aquifer during Spring 2021 are illustrated on **Figure C-1** in **Appendix C**. As shown on the drawing, the general direction of groundwater flow in the Zone 3 aquifer at the MLFRRF is toward the northeast. Groundwater flow direction is consistent with historical data.

3.3 ANALYTICAL RESULTS

The results of the comparison of the analytical data to regulatory standards and to historical trends are discussed below for the volatile organic and inorganic data. In assessing the data, each parameter was evaluated for compliance with the MCLs and SMCLs, with Maryland health-based standards, and with GWPS established for the site.

The current analytical data and the historical analytical data are included in tables in **Appendix A.** The tables present the concentrations over time for organic and inorganic parameters. They provide a simple means of evaluating trends in the concentrations. The "J" qualifier associated with a concentration indicates the compound was detected at a trace concentration below the laboratory RL but above the MDL and as such is an estimated value. The "U" qualifier associated with a concentration indicates the compound was not detected. The "B" qualifier indicates possible laboratory contamination due to the compound being detected in the method or field blank sample analysis.

3.3.1 **MCL Exceedances**

Table 3 lists the MCL exceedances at the site for this sampling event. As shown in **Table 3**, there were four parameters that exceeded their applicable MCLs. Time-series plots for parameter concentrations with historic MCL exceedances for on-site monitoring wells have been constructed to identify potential trends in concentrations over time. These plots are included in **Appendix B**.

Three of the MCL exceedances were consistent with the historical record. There was one first-time MCL exceedance during the Spring 2021 sampling event. The concentration of thallium, 0.0044 J mg/L, in on-site non-regulated well TW-13 exceeded the applicable MCL of 0.002 mg/L. It should be noted that the thallium analysis was performed using EPA Method 6010 rather than Method 6020 as specified in the EMP. TW-13 was re-sampled on June 24th, 2021 and analyzed for thallium using Method 6020. The result of this analysis, using the correct method, yielded a non-detect concentration of thallium (0.001 U mg/L).

3.3.2 **On-site Regulated Monitoring Wells (Subtitle D)**

Appendix I Volatile Organic Compounds

As shown on **Table 4,** nine different VOCs were detected above the RL across 11 different monitoring locations. The concentration of methylene chloride in TW-25A exceeded its applicable MCL, as it has done over the past several years.

All detections of VOCs above the RL were generally consistent with the historical record. No Appendix I VOCs were detected above the RL in the following Subtitle D wells during the Spring 2021 sampling event: TW-02A, TW-03, TW-04B, TW-10A, TW-14A, TW-19, TW-20R, TW-23, TW-24A, TW-27, and TW-30.

Appendix II Volatile Organic Compounds and MTBE

As shown in **Table 5**, detections above the RL of dichlorodifluoromethane, dichlorofluoromethane, and MTBE were noted for four different locations. There were no GWPS or Maryland State Action Level exceedances. In general, concentrations of these parameters are consistent with concentrations measured over the past 10 years.

No Appendix II VOCs were detected above the reporting limit in the following Subtitle D wells during the Spring 2021 sampling event: TW-02A, TW-03, TW-04, TW-04B, TW-05, TW-05A, TW-06 TW-10A, TW-14A, TW-19, TW-20R, TW-23, TW-24, TW-24A, TW-25, TW-27, TW-29, and TW-30.

Inorganics

Mercury was detected at concentrations above the RL only in Subtitle D wells TW-06, TW-24 and TW-24A. Concentrations in all three of these wells were below the applicable MCL.

Iron (total and dissolved), manganese (total and dissolved), and turbidity were detected in many of the regulated monitoring wells (Subtitle D) at concentrations that exceeded the applicable SMCLs. Iron and manganese are typical naturally occurring metals found in groundwater and are not necessarily indicative of contamination from the landfill. Measurements of pH were below the SMCL range for most on-site Subtitle D regulated monitoring wells. Low pH is also typical of groundwater and is believed to be a natural property of groundwater at the MLFRRF. Furthermore, pH concentrations in the downgradient monitoring wells are consistent with those measured in upgradient background groundwater.

Concentrations of inorganic parameters measured during the Spring 2021 sampling event—including those of iron, manganese, and pH—are generally consistent with the historical record.

3.3.3 **On-site Regulated Monitoring Wells (COMAR)**

Appendix I Volatile Organic Compounds

As shown on **Table 6,** there were only two Appendix I VOCs detected above the RL across all COMAR regulated on-site monitoring wells. There were no MCL or GWPS exceedances. These detections are consistent with the historical record. There were no Appendix I VOCs detected above the RL in COMAR regulated wells TW-07, TW-07A, TW-08, TW-08A, TW-09B, TW-09C, TW-15, TW-16, TW-17, TW-17A, TW-21, TW-22, TW-22A, and TW-22B.

Appendix II Volatile Organic Compounds and MTBE

Although they are typically listed in **Table 7**, there were no Appendix II VOCs detected above the RL in COMAR regulated wells during the Spring 2021 monitoring event.

Inorganics

Mercury was detected at a concentration above the RL in one COMAR regulated well (TW-15B). The concentration was below the applicable MCL. Iron (total and dissolved), manganese (total and dissolved), and turbidity were detected in several of the COMAR regulated monitoring wells at concentrations that exceeded their applicable SMCLs. Iron and manganese are typical naturally occurring metals found in groundwater and are not necessarily indicative of contamination from the landfill. Measurements of pH were below the SMCL range for all on-site COMAR regulated monitoring wells. Low pH is also typical of groundwater and is believed to be a natural property of groundwater at the MLFRRF. Furthermore, pH concentrations measured in the downgradient wells are comparable to upgradient background concentrations.

Concentrations of inorganic parameters measured in COMAR regulated monitoring wells during the Spring 2021 sampling event—including those of iron, manganese, and pH—were consistent with the historical record.

3.3.4 **On-site Non-regulated Monitoring Wells**

Volatile Organic Compounds

As shown on **Table 8**, there were four different Appendix I VOCs detected above the RL across two on-site non-regulated monitoring wells during the Spring 2021 sampling event. There was one MCL exceedance—the concentration of TCE exceeded its applicable MCL in well TW-13, as it has done during some previous events. These detections are consistent with the historical record. There were no Appendix I VOCs detected above the RL in the following on-site non-regulated wells: TW-02, TW-03A, TW-05B, TW-06A, TW-06B, TW-09, TW-11A, TW-14B, TW-16A, TW-18, and TW-21A.

Appendix II VOCs detected above the RL are typically shown on **Table 9** but there were no detections above the RL in on-site non-regulated monitoring wells during the Spring 2021 sampling event.

Inorganics

As previously mentioned, the concentration of thallium in on-site non-regulated well TW-13 exceeded the applicable MCL of 0.002 mg/L. However, TW-13 was re-sampled and the resulting concentration was below the MCL.

Mercury was not detected above the RL in any on-site non-regulated monitoring wells. Iron (total and dissolved), manganese (total and dissolved), and turbidity were detected in a few of the on-site non-regulated monitoring wells at concentrations that exceeded their applicable SMCLs. Iron and manganese are typical naturally-occurring metals found in groundwater and are not necessarily indicative of contamination from the landfill. Measurements of pH were below the SMCL range for most on-site non-regulated monitoring wells. Low pH is also typical of groundwater and is believed to be a natural property of groundwater at the MLFRRF. Furthermore, pH concentrations measured in the downgradient wells are comparable to upgradient background concentrations.

Concentrations of inorganic parameters measured in on-site non-regulated monitoring wells during the Spring 2021 sampling event—including those of iron, manganese, and pH—are consistent with the historical record.

3.3.5 **Off-site Non-regulated Monitoring Wells**

Appendix I Volatile Organic Compounds

As shown on **Table 10,** three different Appendix I VOCs were detected above the RL across six different off-site non-regulated monitoring well locations. There were no MCL or GWPS exceedances. In general, VOC concentrations detected above the RL in these wells are consistent with historical concentrations.

Appendix II Volatile Organic Compounds and MTBE

As shown in **Table 11**, detections of dichlorofluoromethane above the RL were observed at two off-site non-regulated monitoring wells. There were no detections of dichlorodifluoromethane or MTBE above the RL. There were no GWPS or Maryland State Action Level exceedances. The detected concentrations of dichlorofluoromethane are generally consistent with the historical record. There were no Appendix II VOCs detected above the RL in well MW-P106, MW-P4, MW-P417, MW-P440, MW-P9, RW-P109, RW-P171-1, RW-P440, RW-P441, and RW-P584.

Inorganics

All off-site non-regulated monitoring wells were analyzed for mercury. Concentrations above the RL were detected in four of these wells. These concentrations were below the MCL and consistent with historical values.

3.3.6 **Off-site Residential Zone 4 Water Supply Wells**

As shown on **Table 12** and **Table 13**, there were no off-site residential Zone 4 water supply wells sampled during the Spring 2021 event.

3.3.7 **Surface Water Sampling Locations**

Appendix I and Appendix II Volatile Organic Compounds

As shown on **Table 14** and **Table 15**, there were no Appendix I or Appendix II VOCs detected above the RL at any surface water monitoring locations during the Spring 2021 sampling event.

Inorganics

There were no MCL exceedances of inorganic parameters at the surface water sampling locations. SMCL exceedances were observed for iron at SW-2 and SW-3, while turbidity exceeded its SMCL at all three locations. In SW-3, the pH was measured above the SMCL range. Concentrations of all detected inorganic parameters at surface water locations were consistent with historical values.

4 STATISTICAL EVALUATION

4.1 INTRODUCTION

In accordance with the EMP and 40 CFR Part 258.53, groundwater sampling and analysis requirements, the groundwater parameters at the MLFRRF have been statistically analyzed. Listed below are the objective of the analysis, the procedures used, and the summary of results. The detailed results of the statistical analysis are included after the text.

4.2 OBJECTIVE

According to the Code of Federal Regulations (40 CFR Part 258), groundwater monitoring data must be statistically analyzed to determine if parameter levels are exceeding background groundwater quality levels at each downgradient well. This goal is met by statistically analyzing the groundwater data that have been collected on the site since 1993. The analyses will determine if the land use may be contributing to groundwater contamination.

4.3 PROCEDURE

Samples have been collected since 1993 and tested for the constituents specified in the EMP. The concentrations observed in the downgradient wells are compared to the concentrations observed in the upgradient wells. If the downgradient samples show significantly higher concentrations than the upgradient samples statistically, it indicates that land use practices are likely affecting the groundwater quality.

The groundwater data were analyzed using the Mann-Whitney Test (Wilcoxon Rank Sum Test) to determine whether the downgradient data differed from the upgradient data with statistical significance. The Mann-Whitney analysis is nonparametric, that is, it assumes no underlying distribution (like the normal distribution) and compares two groups of data and determines whether both groups come from the same population with a certain confidence.

Individual statistical tests have a certain amount of uncertainty associated with them. When multiple tests are combined (from different wells and different constituents), that uncertainty is compounded. An overall network-wide Type I error rate of 5% is required by 40 CFR Part 258.53(h)(2); however, an error rate no less than 1% shall be applied to any single test. A 5% Type I error rate means 5% of the recognized exceedances are in reality not actually elevated above background levels; that is, they represent false positives.

Statistical analyses are performed for all parameters detected over the RL during the Spring 2021 sampling event at downgradient wells. Using the Bonferroni adjustment to account for multiple

statistical comparisons, a Type I error rate of much less than 1% per analysis would result, so a Type I error rate of 1% was used as the minimum allowable under 40 CFR Part 258.52(h)(2).

For each sampling event, an average concentration from the upgradient wells was calculated. The collection of average concentrations for all sampling events was then compared to the concentrations for all sampling events at each of the downgradient wells. For each downgradient well, the upgradient and downgradient concentrations are combined and ranked (the lowest concentration is assigned a rank of 1). Tied concentrations are ranked equally by averaging the ranks that would be assigned to the tied group if they were not tied.

The sum of the ranks, the number of upgradient observations, and the number of downgradient observations are used to calculate the Mann-Whitney Test Statistic (U). The calculated U for each well/parameter pair is compared to a critical U value which is published in tables in statistical texts. Critical U values are based on the number of samples in the upgradient group and at each downgradient well. Therefore, the critical U values vary from parameter-to-parameter and from well-to-well. If the calculated U is greater than the critical U, there is no exceedance at 99% confidence (a 1% Type I error rate for each analysis). Likewise, if the calculated U is less than the critical U, there is an exceedance.

Because the upgradient (background) condition is compared to each downgradient well separately, each well/parameter combination is tested. The results of all of the tests are included following the report text. There may be exceedances in some downgradient wells for a particular parameter, but not in other downgradient wells.

4.4 SUMMARY OF RESULTS

The results of the statistical analysis are shown on **Table 16.** The findings indicated that downgradient samples show constituent concentrations that are statistically significant increases (SSIs) above background levels in all 20 of the downgradient on-site regulated wells. While there were a few new SSIs identified during the Spring 2021 sampling event for which concentrations are below the RL, these are not of major concern because the parameters were detected at trace levels.

There were two new SSIs identified for which parameters were detected above the RL during this sampling event that were not identified during the previous sampling event. These new SSIs consist of 1,4-dichlorobenzene in TW-25A and pH in TW-02A. The SSI for 1,4-dichlorobenzene in TW-25A was not identified during the previous sampling event because statistical tests were not run for this parameter, as it was not detected above the RL in any Subtitle D wells during the Fall 2020 sampling event. However, it is typically detected at low level concentrations in TW-25A, as was the case during the Spring 2021 sampling event. As such, this new SSI is not of major concern. The new SSI identified for pH in well TW-02A is not a concern because although the pH

is elevated compared to the pH values of both background wells, it is more neutral (7.02) than either of the background wells (4.7 and 4.95).

The statistical exceedances are generally consistent with historical exceedances. Concentrations of most parameters that exhibited SSIs have generally been consistent with their historical data set; that is, no trend is apparent in the concentrations.

5 RECOMMENDATIONS

The results of the Spring 2021 groundwater sampling event indicate that overall, groundwater conditions are generally consistent with historical data for the MLFRRF. Many monitoring wells continue to show VOC concentrations lower than historical data. While the data and statistical evaluations indicate that a release of landfill constituents to groundwater may have occurred, the site-specific hydrogeology and the corrective measures already implemented by the County have limited the potential for any adverse effects on human health and the environment. It is recommended that regular groundwater monitoring be continued in accordance with the EMP.
