All analytes were below the report limit in the method blank, where applicable, with any exceptions noted below.

Laboratory Control Spike:
All laboratory control spike compounds were within QC limits with any exceptions noted below.

Matrix Spikes:
All percent recoveries and relative percent differences (RPDs) were within acceptance criteria with any exceptions noted below.

Additional Comments:

This report shall not be reproduced, except in full,

PROJECT NARRATIVE

Project: MLF-2023
Pace Project No.: 30635401

Method: **EPA 9038**
Description: 9038 Sulfate, Turbidimetric
Client: Environmental Monitoring and Assessment LLC
Date: November 16, 2023

General Information:
14 samples were analyzed for EPA 9038 by Pace Analytical Services Greensburg. All samples were received in acceptable condition with any exceptions noted below or on the chain-of custody and/or the sample condition upon receipt form (SCUR) attached at the end of this report.

Hold Time:
The samples were analyzed within the method required hold times with any exceptions noted below.

Method Blank:
All analytes were below the report limit in the method blank, where applicable, with any exceptions noted below.

Laboratory Control Spike:
All laboratory control spike compounds were within QC limits with any exceptions noted below.

Matrix Spikes:
All percent recoveries and relative percent differences (RPDs) were within acceptance criteria with any exceptions noted below.

QC Batch: 626793

A matrix spike and/or matrix spike duplicate (MS/MSD) were performed on the following sample(s): 30635401010,30635401014

MH: Matrix spike recovery and/or matrix spike duplicate recovery was above laboratory control limits. Result may be biased high.

- MS (Lab ID: 3055355)
  - Sulfate
- MSD (Lab ID: 3055356)
  - Sulfate

Additional Comments:

This data package has been reviewed for quality and completeness and is approved for release.

QUALIFIERS

Project: MLF-2023
Pace Project No.: 30635401

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Reported results are not rounded until the final step prior to reporting. Therefore, calculated parameters that are typically reported as "Total" may vary slightly from the sum of the reported component parameters.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

SAMPLE QUALIFIERS

Sample: 30635401001

ANALYTE QUALIFIERS

1c	Alkalinity TV: 0.00 mg/L
2c	Alkalinity TV: 2.00 mg/L
3c	Alkalinity TV: 4.00 mg/L
CH	The continuing calibration for this compound is outside of Pace Analytical acceptance limits. The results may be biased high.
M1	Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.
MH	Matrix spike recovery and/or matrix spike duplicate recovery was above laboratory control limits. Result may be biased high.
ML	Matrix spike recovery and/or matrix spike duplicate recovery was below laboratory control limits. Result may be biased low.
N3	Accreditation is not offered by the relevant laboratory accrediting body for this parameter.

RE: Project: MLF-FALL 2023
Pace Project No.: 30636257

Dear Steve Brown:

Enclosed are the analytical results for sample(s) received by the laboratory on November 02, 2023. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Beaver
- Pace Analytical Services - Greensburg

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Alaina Deitch

PROJECT NARRATIVE

Project: MLF-FALL 2023
Pace Project No.: 30636257

Method: **EPA 6010D**
Description: BVR 6010D ICP, Water, 3010A
Client: Environmental Monitoring and Assessment LLC
Date: November 20, 2023

General Information:
9 samples were analyzed for EPA 6010D by Pace Analytical Services Beaver. All samples were received in acceptable condition with any exceptions noted below or on the chain-of custody and/or the sample condition upon receipt form (SCUR) attached at the end of this report.

Hold Time:
The samples were analyzed within the method required hold times with any exceptions noted below.

Sample Preparation:
The samples were prepared in accordance with EPA 3010A with any exceptions noted below.

Initial Calibrations (including MS Tune as applicable):
All criteria were within method requirements with any exceptions noted below.

Continuing Calibration:
All criteria were within method requirements with any exceptions noted below.

Internal Standards:
All internal standards were within QC limits with any exceptions noted below.

Surrogates:
All surrogates were within QC limits with any exceptions noted below.

Method Blank:
All analytes were below the report limit in the method blank, where applicable, with any exceptions noted below.

Laboratory Control Spike:
All laboratory control spike compounds were within QC limits with any exceptions noted below.

Matrix Spikes:
All percent recoveries and relative percent differences (RPDs) were within acceptance criteria with any exceptions noted below.

QC Batch: 627741

A matrix spike and/or matrix spike duplicate (MS/MSD) were performed on the following sample(s): 30633508003

M1: Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.

- MSD (Lab ID: 3059876)
  - Calcium
  - Iron
  - Magnesium

PROJECT NARRATIVE

Project: MLF-FALL 2023
Pace Project No.: 30636257

Method: **SM 2320B-2011**
Description: 2320B Alkalinity
Client: Environmental Monitoring and Assessment LLC
Date: November 20, 2023

General Information:
9 samples were analyzed for SM 2320B-2011 by Pace Analytical Services Greensburg. All samples were received in acceptable condition with any exceptions noted below or on the chain-of custody and/or the sample condition upon receipt form (SCUR) attached at the end of this report.

Hold Time:
The samples were analyzed within the method required hold times with any exceptions noted below.

Method Blank:
All analytes were below the report limit in the method blank, where applicable, with any exceptions noted below.

Laboratory Control Spike:
All laboratory control spike compounds were within QC limits with any exceptions noted below.

Matrix Spikes:
All percent recoveries and relative percent differences (RPDs) were within acceptance criteria with any exceptions noted below.

Additional Comments:

PROJECT NARRATIVE

Project: MLF-FALL 2023
Pace Project No.: 30636257

Method: **EPA 350.1**
Description: 350.1 Ammonia, Distilled
Client: Environmental Monitoring and Assessment LLC
Date: November 20, 2023

General Information:
9 samples were analyzed for EPA 350.1 by Pace Analytical Services Greensburg. All samples were received in acceptable condition with any exceptions noted below or on the chain-of custody and/or the sample condition upon receipt form (SCUR) attached at the end of this report.

Hold Time:
The samples were analyzed within the method required hold times with any exceptions noted below.

Sample Preparation:
The samples were prepared in accordance with EPA 350.1 with any exceptions noted below.

Method Blank:
All analytes were below the report limit in the method blank, where applicable, with any exceptions noted below.

Laboratory Control Spike:
All laboratory control spike compounds were within QC limits with any exceptions noted below.

Matrix Spikes:
All percent recoveries and relative percent differences (RPDs) were within acceptance criteria with any exceptions noted below.

QC Batch: 629365

A matrix spike and/or matrix spike duplicate (MS/MSD) were performed on the following sample(s): 30635630001,30636257003

MH: Matrix spike recovery and/or matrix spike duplicate recovery was above laboratory control limits. Result may be biased high.

- MSD (Lab ID: 3068262)
  - Ammonia, Distilled

QUALIFIERS

Project: MLF-FALL 2023
Pace Project No.: 30636257

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Reported results are not rounded until the final step prior to reporting. Therefore, calculated parameters that are typically reported as "Total" may vary slightly from the sum of the reported component parameters.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

BATCH QUALIFIERS

Batch: 629109

[M5]	A matrix spike/matrix spike duplicate was not performed for this batch due to insufficient sample volume.

ANALYTE QUALIFIERS

1c	8011 SAMPLE pH IS 7
2c	A matrix spike/matrix spike duplicate was not performed for this batch due to insufficient sample volume.
3c	Alkalinity TV: 0.00 mg/L
4c	Alkalinity TV: 2.00 mg/L
5c	pH is 7
B	Analyte was detected in the associated method blank.
CH	The continuing calibration for this compound is outside of Pace Analytical acceptance limits. The results may be biased high.
H2	Extraction or preparation conducted outside EPA method holding time.
L2	Analyte recovery in the laboratory control sample (LCS) was below QC limits. Results for this analyte in associated samples may be biased low.
M1	Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.
MH	Matrix spike recovery and/or matrix spike duplicate recovery was above laboratory control limits. Result may be biased high.
ML	Matrix spike recovery and/or matrix spike duplicate recovery was below laboratory control limits. Result may be biased low.

RE: Project: Millersville Landfill
Pace Project No.: 30636586

Dear Steve Brown:

Enclosed are the analytical results for sample(s) received by the laboratory on November 03, 2023. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Beaver
- Pace Analytical Services - Greensburg

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Alaina Deitch

PROJECT NARRATIVE

Project: Millersville Landfill
Pace Project No.: 30636586

Method: **EPA 6010D**
Description: BVR 6010D ICP, Water, 3010A
Client: Environmental Monitoring and Assessment LLC
Date: November 21, 2023

General Information:
9 samples were analyzed for EPA 6010D by Pace Analytical Services Beaver. All samples were received in acceptable condition with any exceptions noted below or on the chain-of custody and/or the sample condition upon receipt form (SCUR) attached at the end of this report.

Hold Time:
The samples were analyzed within the method required hold times with any exceptions noted below.

Sample Preparation:
The samples were prepared in accordance with EPA 3010A with any exceptions noted below.

Initial Calibrations (including MS Tune as applicable):
All criteria were within method requirements with any exceptions noted below.

Continuing Calibration:
All criteria were within method requirements with any exceptions noted below.

Internal Standards:
All internal standards were within QC limits with any exceptions noted below.

Surrogates:
All surrogates were within QC limits with any exceptions noted below.

Method Blank:
All analytes were below the report limit in the method blank, where applicable, with any exceptions noted below.

QC Batch: 628236

B: Analyte was detected in the associated method blank.
- BLANK for HBN 628236 [BMPR/142 (Lab ID: 3062492)
  - Iron

Laboratory Control Spike:
All laboratory control spike compounds were within QC limits with any exceptions noted below.

Matrix Spikes:
All percent recoveries and relative percent differences (RPDs) were within acceptance criteria with any exceptions noted below.

Additional Comments:

This report shall not be reproduced, except in full,

PROJECT NARRATIVE

Project: Millersville Landfill
Pace Project No.: 30636586

Method: **EPA 8011**
Description: 8011 GCS EDB and DBCP
Client: Environmental Monitoring and Assessment LLC
Date: November 21, 2023

QC Batch: 627896

SR: Surrogate recovery was below laboratory control limits. Results may be biased low.

- 1,1,1,2-Tetrachloroethane (S)
- MS (Lab ID: 3060560)
  - 1,1,1,2-Tetrachloroethane (S)
- MSD (Lab ID: 3060561)
  - 1,1,1,2-Tetrachloroethane (S)
- TW-15 (Lab ID: 30636586002)
  - 1,1,1,2-Tetrachloroethane (S)
- TW-15B (Lab ID: 30636586003)
  - 1,1,1,2-Tetrachloroethane (S)
- TW-9 (Lab ID: 30636586001)
  - 1,1,1,2-Tetrachloroethane (S)

Method Blank:
All analytes were below the report limit in the method blank, where applicable, with any exceptions noted below.

Laboratory Control Spike:
All laboratory control spike compounds were within QC limits with any exceptions noted below.

QC Batch: 627896

L2: Analyte recovery in the laboratory control sample (LCS) was below QC limits. Results for this analyte in associated samples may be biased low.

- LCS (Lab ID: 3060559)
  - 1,2-Dibromo-3-chloropropane
  - 1,2-Dibromoethane (EDB)

Matrix Spikes:
All percent recoveries and relative percent differences (RPDs) were within acceptance criteria with any exceptions noted below.

QC Batch: 627896

A matrix spike and/or matrix spike duplicate (MS/MSD) were performed on the following sample(s): 30636257002

ML: Matrix spike recovery and/or matrix spike duplicate recovery was below laboratory control limits. Result may be biased low.

- MS (Lab ID: 3060560)
  - 1,2-Dibromo-3-chloropropane
  - 1,2-Dibromoethane (EDB)
- MSD (Lab ID: 3060561)
  - 1,2-Dibromo-3-chloropropane
  - 1,2-Dibromoethane (EDB)

QC Batch: 629109

A matrix spike/matrix spike duplicate was not performed due to insufficient sample volume.

PROJECT NARRATIVE

Project: Millersville Landfill
Pace Project No.: 30636586

Method: **SM 2320B-2011**
Description: 2320B Alkalinity
Client: Environmental Monitoring and Assessment LLC
Date: November 21, 2023

General Information:
9 samples were analyzed for SM 2320B-2011 by Pace Analytical Services Greensburg. All samples were received in acceptable condition with any exceptions noted below or on the chain-of custody and/or the sample condition upon receipt form (SCUR) attached at the end of this report.

Hold Time:
The samples were analyzed within the method required hold times with any exceptions noted below.

Method Blank:
All analytes were below the report limit in the method blank, where applicable, with any exceptions noted below.

Laboratory Control Spike:
All laboratory control spike compounds were within QC limits with any exceptions noted below.

Matrix Spikes:
All percent recoveries and relative percent differences (RPDs) were within acceptance criteria with any exceptions noted below.

QUALIFIERS

Project: Millersville Landfill
Pace Project No.: 30636586

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Reported results are not rounded until the final step prior to reporting. Therefore, calculated parameters that are typically reported as "Total" may vary slightly from the sum of the reported component parameters.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

BATCH QUALIFIERS

Batch: 629109

[M5]	A matrix spike/matrix spike duplicate was not performed for this batch due to insufficient sample volume.

ANALYTE QUALIFIERS

1c	8011 SAMPLE pH IS 7
2c	A matrix spike/matrix spike duplicate was not performed for this batch due to insufficient sample volume.
3c	Alkalinity TV: -1.00 mg/L
4c	Alkalinity TV: -2.00 mg/L
5c	Alkalinity TV: 0.00 mg/L
6c	Alkalinity TV: 2.00 mg/L
7c	Alkalinity TV: 4.00 mg/L
8c	pH is 7
B	Analyte was detected in the associated method blank.
CH	The continuing calibration for this compound is outside of Pace Analytical acceptance limits. The results may be biased high.
H2	Extraction or preparation conducted outside EPA method holding time.
L2	Analyte recovery in the laboratory control sample (LCS) was below QC limits. Results for this analyte in associated samples may be biased low.

This report shall not be reproduced, except in full,

QUALIFIERS

Project: Millersville Landfill
Pace Project No.: 30636586

ANALYTE QUALIFIERS

M1	Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.
ML	Matrix spike recovery and/or matrix spike duplicate recovery was below laboratory control limits. Result may be biased low.
N3	Accreditation is not offered by the relevant laboratory accrediting body for this parameter.
SR	Surrogate recovery was below laboratory control limits. Results may be biased low.

This report shall not be reproduced, except in full,

RE: Project: MLF-FALL 2023-Revised Report
Pace Project No.: 30637219

Dear Steve Brown:

Enclosed are the analytical results for sample(s) received by the laboratory on November 07, 2023. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Beaver
- Pace Analytical Services - Greensburg

(Greensburg, PA) - Revision 2 - This report replaces the November 27, 2023 report. This project was revised on December, 12, 2023 to include Ca, Fe, Mg, Mn, K, and Na to 6010 metals analysis.

(Greensburg, PA) - Revision 3 - This report replaces the December 12, 2023 report. This project was revised on December, 12, 2023 to include lead analysis.

(Greensburg, PA) - Revision 4 - This report replaces the December 12, 2023 report. This project was revised on December, 12, 2023 to include update units to mg/L.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Megan A Rager

PROJECT NARRATIVE

Project: MLF-FALL 2023-Revised Report
Pace Project No.: 30637219

Method: **EPA 6010D**
Description: BVR 6010D ICP, Water, 3010A
Client: Environmental Monitoring and Assessment LLC
Date: December 12, 2023

General Information:
3 samples were analyzed for EPA 6010D by Pace Analytical Services Beaver. All samples were received in acceptable condition with any exceptions noted below or on the chain-of custody and/or the sample condition upon receipt form (SCUR) attached at the end of this report.

Hold Time:
The samples were analyzed within the method required hold times with any exceptions noted below.

Sample Preparation:
The samples were prepared in accordance with EPA 3010A with any exceptions noted below.

Initial Calibrations (including MS Tune as applicable):
All criteria were within method requirements with any exceptions noted below.

Continuing Calibration:
All criteria were within method requirements with any exceptions noted below.

Internal Standards:
All internal standards were within QC limits with any exceptions noted below.

Surrogates:
All surrogates were within QC limits with any exceptions noted below.

Method Blank:
All analytes were below the report limit in the method blank, where applicable, with any exceptions noted below.

Laboratory Control Spike:
All laboratory control spike compounds were within QC limits with any exceptions noted below.

Matrix Spikes:
All percent recoveries and relative percent differences (RPDs) were within acceptance criteria with any exceptions noted below.

QC Batch: 629212

A matrix spike and/or matrix spike duplicate (MS/MSD) were performed on the following sample(s): 30638150002

M1: Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.

- MS (Lab ID: 3067629)
  - Sodium
- MSD (Lab ID: 3067630)
  - Sodium

Additional Comments:

QUALIFIERS

Project: MLF-FALL 2023-Revised Report
Pace Project No.: 30637219

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Reported results are not rounded until the final step prior to reporting. Therefore, calculated parameters that are typically reported as "Total" may vary slightly from the sum of the reported component parameters.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

WORKORDER QUALIFIERS

WO: 30637219

[1]	(Greensburg, PA) - Revision 1 - This report replaces the November, 17, 2023 report. This project was revised on November, 20, 2023 to update the units from ug/L to mg/L.

ANALYTE QUALIFIERS

E	Analyte concentration exceeded the calibration range. The reported result is estimated.
M1	Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.
ML	Matrix spike recovery and/or matrix spike duplicate recovery was below laboratory control limits. Result may be biased low.
N3	Accreditation is not offered by the relevant laboratory accrediting body for this parameter.

This report shall not be reproduced, except in full,

RE: Project: MLF-FALL 2023
Pace Project No.: 30638010

Dear Steve Brown:

Enclosed are the analytical results for sample(s) received by the laboratory on November 08, 2023. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Beaver
- Pace Analytical Services - Greensburg

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Alaina Deitch

PROJECT NARRATIVE

Project: MLF-FALL 2023
Pace Project No.: 30638010

Method: **EPA 6010D**
Description: BVR 6010D ICP, Water, 3010A
Client: Environmental Monitoring and Assessment LLC
Date: November 30, 2023

General Information:
4 samples were analyzed for EPA 6010D by Pace Analytical Services Beaver. All samples were received in acceptable condition with any exceptions noted below or on the chain-of custody and/or the sample condition upon receipt form (SCUR) attached at the end of this report.

Hold Time:
The samples were analyzed within the method required hold times with any exceptions noted below.

Sample Preparation:
The samples were prepared in accordance with EPA 3010A with any exceptions noted below.

Initial Calibrations (including MS Tune as applicable):
All criteria were within method requirements with any exceptions noted below.

Continuing Calibration:
All criteria were within method requirements with any exceptions noted below.

Internal Standards:
All internal standards were within QC limits with any exceptions noted below.

Surrogates:
All surrogates were within QC limits with any exceptions noted below.

Method Blank:
All analytes were below the report limit in the method blank, where applicable, with any exceptions noted below.

Laboratory Control Spike:
All laboratory control spike compounds were within QC limits with any exceptions noted below.

Matrix Spikes:
All percent recoveries and relative percent differences (RPDs) were within acceptance criteria with any exceptions noted below.

QC Batch: 629212

A matrix spike and/or matrix spike duplicate (MS/MSD) were performed on the following sample(s): 30638150002

M1: Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.

- MS (Lab ID: 3067629)
  - Sodium
- MSD (Lab ID: 3067630)
  - Sodium

4 samples were analyzed for EPA 350.1 by Pace Analytical Services Greensburg. All samples were received in acceptable condition with any exceptions noted below or on the chain-of custody and/or the sample condition upon receipt form (SCUR) attached at the end of this report.

Hold Time:
The samples were analyzed within the method required hold times with any exceptions noted below.

Sample Preparation:
The samples were prepared in accordance with EPA 350.1 with any exceptions noted below.

Method Blank:
All analytes were below the report limit in the method blank, where applicable, with any exceptions noted below.

Laboratory Control Spike:
All laboratory control spike compounds were within QC limits with any exceptions noted below.

Matrix Spikes:
All percent recoveries and relative percent differences (RPDs) were within acceptance criteria with any exceptions noted below.

Additional Comments:

This report shall not be reproduced, except in full,

PROJECT NARRATIVE

Project: MLF-FALL 2023
Pace Project No.: 30638010

Method: **EPA 410.4**
Description: 410.4 COD
Client: Environmental Monitoring and Assessment LLC
Date: November 30, 2023

General Information:
4 samples were analyzed for EPA 410.4 by Pace Analytical Services Greensburg. All samples were received in acceptable condition with any exceptions noted below or on the chain-of custody and/or the sample condition upon receipt form (SCUR) attached at the end of this report.

Hold Time:
The samples were analyzed within the method required hold times with any exceptions noted below.

Sample Preparation:
The samples were prepared in accordance with EPA 410.4 with any exceptions noted below.

Method Blank:
All analytes were below the report limit in the method blank, where applicable, with any exceptions noted below.

Laboratory Control Spike:
All laboratory control spike compounds were within QC limits with any exceptions noted below.

Matrix Spikes:
All percent recoveries and relative percent differences (RPDs) were within acceptance criteria with any exceptions noted below.

Additional Comments:

This report shall not be reproduced, except in full,

PROJECT NARRATIVE

Project: MLF-FALL 2023
Pace Project No.: 30638010

Method: **SM 4500-Cl-E-2011**
Description: 4500 Chloride
Client: Environmental Monitoring and Assessment LLC
Date: November 30, 2023

General Information:
4 samples were analyzed for SM 4500-Cl-E-2011 by Pace Analytical Services Greensburg. All samples were received in acceptable condition with any exceptions noted below or on the chain-of custody and/or the sample condition upon receipt form (SCUR) attached at the end of this report.

Hold Time:
The samples were analyzed within the method required hold times with any exceptions noted below.

Method Blank:
All analytes were below the report limit in the method blank, where applicable, with any exceptions noted below.

Laboratory Control Spike:
All laboratory control spike compounds were within QC limits with any exceptions noted below.

Matrix Spikes:
All percent recoveries and relative percent differences (RPDs) were within acceptance criteria with any exceptions noted below.

PROJECT NARRATIVE

Project: MLF-FALL 2023
Pace Project No.: 30638010

Method: **EPA 9038**
Description: 9038 Sulfate, Turbidimetric
Client: Environmental Monitoring and Assessment LLC
Date: November 30, 2023

General Information:
4 samples were analyzed for EPA 9038 by Pace Analytical Services Greensburg. All samples were received in acceptable condition with any exceptions noted below or on the chain-of custody and/or the sample condition upon receipt form (SCUR) attached at the end of this report.

Hold Time:
The samples were analyzed within the method required hold times with any exceptions noted below.

Method Blank:
All analytes were below the report limit in the method blank, where applicable, with any exceptions noted below.

Laboratory Control Spike:
All laboratory control spike compounds were within QC limits with any exceptions noted below.

Matrix Spikes:
All percent recoveries and relative percent differences (RPDs) were within acceptance criteria with any exceptions noted below.

Additional Comments:

This data package has been reviewed for quality and completeness and is approved for release.

QUALIFIERS

Project: MLF-FALL 2023
Pace Project No.: 30638010

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Reported results are not rounded until the final step prior to reporting. Therefore, calculated parameters that are typically reported as "Total" may vary slightly from the sum of the reported component parameters.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

SAMPLE QUALIFIERS

Sample: 30638010001

[1] Sample pH for 8011 is 5

Sample: 30638010002

[1] Sample pH for 8011 is 5

Sample: 30638010003

[1] Sample pH for 8011 is 6

Sample: 30638010004

[1] Sample pH for 8011 is 5

ANALYTE QUALIFIERS

1c	Alkalinity TV: 0.00 mg/L
E	Analyte concentration exceeded the calibration range. The reported result is estimated.
M1	Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.
N3	Accreditation is not offered by the relevant laboratory accrediting body for this parameter.

RE: Project: Millersville Landfill
Pace Project No.: 30638286

Dear Steve Brown:

Enclosed are the analytical results for sample(s) received by the laboratory on November 09, 2023. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Beaver
- Pace Analytical Services - Greensburg

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Alaina Deitch

PROJECT NARRATIVE

Project: Millersville Landfill
Pace Project No.: 30638286

Method: **EPA 6010D**
Description: BVR 6010D ICP, Water, 3010A
Client: Environmental Monitoring and Assessment LLC
Date: November 29, 2023

General Information:
7 samples were analyzed for EPA 6010D by Pace Analytical Services Beaver. All samples were received in acceptable condition with any exceptions noted below or on the chain-of custody and/or the sample condition upon receipt form (SCUR) attached at the end of this report.

Hold Time:
The samples were analyzed within the method required hold times with any exceptions noted below.

Sample Preparation:
The samples were prepared in accordance with EPA 3010A with any exceptions noted below.

Initial Calibrations (including MS Tune as applicable):
All criteria were within method requirements with any exceptions noted below.

Continuing Calibration:
All criteria were within method requirements with any exceptions noted below.

Internal Standards:
All internal standards were within QC limits with any exceptions noted below.

Surrogates:
All surrogates were within QC limits with any exceptions noted below.

Method Blank:
All analytes were below the report limit in the method blank, where applicable, with any exceptions noted below.

Laboratory Control Spike:
All laboratory control spike compounds were within QC limits with any exceptions noted below.

Matrix Spikes:
All percent recoveries and relative percent differences (RPDs) were within acceptance criteria with any exceptions noted below.

QC Batch: 629226

A matrix spike and/or matrix spike duplicate (MS/MSD) were performed on the following sample(s): 30638286001

M1: Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.

- MS (Lab ID: 3067678)
  - Iron

QUALIFIERS

Project: Millersville Landfill
Pace Project No.: 30638286

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Reported results are not rounded until the final step prior to reporting. Therefore, calculated parameters that are typically reported as "Total" may vary slightly from the sum of the reported component parameters.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

RE: Project: Millersville Landfill
Pace Project No.: 30640354

Dear Steve Brown:

Enclosed are the analytical results for sample(s) received by the laboratory on November 17, 2023. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Beaver
- Pace Analytical Services - Greensburg

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Alaina Deitch

PROJECT NARRATIVE

Project: Millersville Landfill
Pace Project No.: 30640354

Method: **EPA 6010D**
Description: BVR 6010D ICP, Water, 3010A
Client: Environmental Monitoring and Assessment LLC
Date: November 28, 2023

General Information:
3 samples were analyzed for EPA 6010D by Pace Analytical Services Beaver. All samples were received in acceptable condition with any exceptions noted below or on the chain-of custody and/or the sample condition upon receipt form (SCUR) attached at the end of this report.

Hold Time:
The samples were analyzed within the method required hold times with any exceptions noted below.

Sample Preparation:
The samples were prepared in accordance with EPA 3010A with any exceptions noted below.

Initial Calibrations (including MS Tune as applicable):
All criteria were within method requirements with any exceptions noted below.

Continuing Calibration:
All criteria were within method requirements with any exceptions noted below.

Internal Standards:
All internal standards were within QC limits with any exceptions noted below.

Surrogates:
All surrogates were within QC limits with any exceptions noted below.

Method Blank:
All analytes were below the report limit in the method blank, where applicable, with any exceptions noted below.

Laboratory Control Spike:
All laboratory control spike compounds were within QC limits with any exceptions noted below.

Matrix Spikes:
All percent recoveries and relative percent differences (RPDs) were within acceptance criteria with any exceptions noted below.

Additional Comments:

This report shall not be reproduced, except in full,

PROJECT NARRATIVE

Project: Millersville Landfill
Pace Project No.: 30640354

Method: **EPA 8011**
Description: 8011 GCS EDB and DBCP
Client: Environmental Monitoring and Assessment LLC
Date: November 28, 2023

QC Batch: 630990

L2: Analyte recovery in the laboratory control sample (LCS) was below QC limits. Results for this analyte in associated samples may be biased low.

- 1,2-Dibromo-3-chloropropane
- 1,2-Dibromoethane (EDB)

Matrix Spikes:
All percent recoveries and relative percent differences (RPDs) were within acceptance criteria with any exceptions noted below.

Additional Comments:

Analyte Comments:

QC Batch: 630990

P2: Re-extraction or re-analysis could not be performed due to insufficient sample amount.

- TW-1 (Lab ID: 30640354001)
  - 1,2-Dibromo-3-chloropropane
  - 1,2-Dibromoethane (EDB)

PROJECT NARRATIVE

Project: Millersville Landfill
Pace Project No.: 30640354

Method: **SM 2320B-2011**
Description: 2320B Alkalinity
Client: Environmental Monitoring and Assessment LLC
Date: November 28, 2023

General Information:
3 samples were analyzed for SM 2320B-2011 by Pace Analytical Services Greensburg. All samples were received in acceptable condition with any exceptions noted below or on the chain-of custody and/or the sample condition upon receipt form (SCUR) attached at the end of this report.

Hold Time:
The samples were analyzed within the method required hold times with any exceptions noted below.

Method Blank:
All analytes were below the report limit in the method blank, where applicable, with any exceptions noted below.

Laboratory Control Spike:
All laboratory control spike compounds were within QC limits with any exceptions noted below.

Matrix Spikes:
All percent recoveries and relative percent differences (RPDs) were within acceptance criteria with any exceptions noted below.

Additional Comments:

Analyte Comments:

QC Batch: 631383

PROJECT NARRATIVE

Project: Millersville Landfill
Pace Project No.: 30640354

Method: **EPA 350.1**
Description: 350.1 Ammonia, Distilled
Client: Environmental Monitoring and Assessment LLC
Date: November 28, 2023

General Information:
3 samples were analyzed for EPA 350.1 by Pace Analytical Services Greensburg. All samples were received in acceptable condition with any exceptions noted below or on the chain-of custody and/or the sample condition upon receipt form (SCUR) attached at the end of this report.

Hold Time:
The samples were analyzed within the method required hold times with any exceptions noted below.

Sample Preparation:
The samples were prepared in accordance with EPA 350.1 with any exceptions noted below.

Method Blank:
All analytes were below the report limit in the method blank, where applicable, with any exceptions noted below.

Laboratory Control Spike:
All laboratory control spike compounds were within QC limits with any exceptions noted below.

Matrix Spikes:
All percent recoveries and relative percent differences (RPDs) were within acceptance criteria with any exceptions noted below.

PROJECT NARRATIVE

Project: Millersville Landfill
Pace Project No.: 30640354

Method: **EPA 410.4**
Description: 410.4 COD
Client: Environmental Monitoring and Assessment LLC
Date: November 28, 2023

General Information:
3 samples were analyzed for EPA 410.4 by Pace Analytical Services Greensburg. All samples were received in acceptable condition with any exceptions noted below or on the chain-of custody and/or the sample condition upon receipt form (SCUR) attached at the end of this report.

Hold Time:
The samples were analyzed within the method required hold times with any exceptions noted below.

Sample Preparation:
The samples were prepared in accordance with EPA 410.4 with any exceptions noted below.

Method Blank:
All analytes were below the report limit in the method blank, where applicable, with any exceptions noted below.

Laboratory Control Spike:
All laboratory control spike compounds were within QC limits with any exceptions noted below.

Matrix Spikes:
All percent recoveries and relative percent differences (RPDs) were within acceptance criteria with any exceptions noted below.

QC Batch: 630987

A matrix spike and/or matrix spike duplicate (MS/MSD) were performed on the following sample(s): 30640354003

MH: Matrix spike recovery and/or matrix spike duplicate recovery was above laboratory control limits. Result may be biased high.

- MSD (Lab ID: 3076581)
  - Chemical Oxygen Demand

QUALIFIERS

Project: Millersville Landfill
Pace Project No.: 30640354

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Reported results are not rounded until the final step prior to reporting. Therefore, calculated parameters that are typically reported as "Total" may vary slightly from the sum of the reported component parameters.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

SAMPLE QUALIFIERS

Sample: 30640354001

[1] Sample pH for 8011 is 6

Sample: 30640354002

[1] Sample pH for 8011 is 5

Sample: 30640354003

[1] Sample pH for 8011 is 6

ANALYTE QUALIFIERS

1c	Alkalinity TV: 0.00 mg/L
2c	Alkalinity TV: 2.00 mg/L
B	Analyte was detected in the associated method blank.
CH	The continuing calibration for this compound is outside of Pace Analytical acceptance limits. The results may be biased high.
L2	Analyte recovery in the laboratory control sample (LCS) was below QC limits. Results for this analyte in associated samples may be biased low.
M1	Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.
MH	Matrix spike recovery and/or matrix spike duplicate recovery was above laboratory control limits. Result may be biased high.
ML	Matrix spike recovery and/or matrix spike duplicate recovery was below laboratory control limits. Result may be biased low.

RE: Project: MLF-FALL 2023
Pace Project No.: 30640766

Dear Steve Brown:

Enclosed are the analytical results for sample(s) received by the laboratory on November 17, 2023. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Greensburg

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Alaina Deitch

Alaina R. Deitch

PROJECT NARRATIVE

Project: MLF-FALL 2023
Pace Project No.: 30640766

Method: **EPA 8011**
Description: 8011 GCS EDB and DBCP
Client: Environmental Monitoring and Assessment LLC
Date: November 22, 2023

General Information:
12 samples were analyzed for EPA 8011 by Pace Analytical Services Greensburg. All samples were received in acceptable condition with any exceptions noted below or on the chain-of custody and/or the sample condition upon receipt form (SCUR) attached at the end of this report.

Hold Time:
The samples were analyzed within the method required hold times with any exceptions noted below.

Sample Preparation:
The samples were prepared in accordance with EPA 8011 with any exceptions noted below.

Initial Calibrations (including MS Tune as applicable):
All criteria were within method requirements with any exceptions noted below.

Continuing Calibration:
All criteria were within method requirements with any exceptions noted below.

QC Batch: 631280

CH: The continuing calibration for this compound is outside of Pace Analytical acceptance limits. The results may be biased high.

QUALIFIERS

Project: MLF-FALL 2023
Pace Project No.: 30640766

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Reported results are not rounded until the final step prior to reporting. Therefore, calculated parameters that are typically reported as "Total" may vary slightly from the sum of the reported component parameters.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

SAMPLE QUALIFIERS

Sample: 30640766001
[1] Sample pH for 8011 is 6

RE: Project: MLF-FALL-2023
Pace Project No.: 30641025

Dear Steve Brown:

Enclosed are the analytical results for sample(s) received by the laboratory on November 20, 2023. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Beaver
- Pace Analytical Services - Greensburg

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Alaina Deitch

Project: MLF-FALL-2023
Pace Project No.: 30641025

Method: **EPA 6010D**
Description: BVR 6010D ICP, Water, 3010A
Client: Environmental Monitoring and Assessment LLC
Date: December 12, 2023

General Information:
1 sample was analyzed for EPA 6010D by Pace Analytical Services Beaver. All samples were received in acceptable condition with any exceptions noted below or on the chain-of custody and/or the sample condition upon receipt form (SCUR) attached at the end of this report.

Hold Time:
The samples were analyzed within the method required hold times with any exceptions noted below.

Sample Preparation:
The samples were prepared in accordance with EPA 3010A with any exceptions noted below.

Initial Calibrations (including MS Tune as applicable):
All criteria were within method requirements with any exceptions noted below.

Continuing Calibration:
All criteria were within method requirements with any exceptions noted below.

Internal Standards:
All internal standards were within QC limits with any exceptions noted below.

Surrogates:
All surrogates were within QC limits with any exceptions noted below.

Method Blank:
All analytes were below the report limit in the method blank, where applicable, with any exceptions noted below.

Laboratory Control Spike:
All laboratory control spike compounds were within QC limits with any exceptions noted below.

Matrix Spikes:
All percent recoveries and relative percent differences (RPDs) were within acceptance criteria with any exceptions noted below.

Additional Comments:

This report shall not be reproduced, except in full,

PROJECT NARRATIVE

Project: MLF-FALL-2023
Pace Project No.: 30641025

Method: **SM 2540C-2015**
Description: 2540C Total Dissolved Solids
Client: Environmental Monitoring and Assessment LLC
Date: December 12, 2023

General Information:
1 sample was analyzed for SM 2540C-2015 by Pace Analytical Services Greensburg. All samples were received in acceptable condition with any exceptions noted below or on the chain-of custody and/or the sample condition upon receipt form (SCUR) attached at the end of this report.

Hold Time:
The samples were analyzed within the method required hold times with any exceptions noted below.

Method Blank:
All analytes were below the report limit in the method blank, where applicable, with any exceptions noted below.

Laboratory Control Spike:
All laboratory control spike compounds were within QC limits with any exceptions noted below.

Matrix Spikes:
All percent recoveries and relative percent differences (RPDs) were within acceptance criteria with any exceptions noted below.

Duplicate Sample:
All duplicate sample results were within method acceptance criteria with any exceptions noted below.

Additional Comments:

Analyte Comments:

QC Batch: 631606

1c: Total dissolved solids results for ASTM Leach cannot be used for compliance purpose

- BLANK (Lab ID: 3079423)
  - Total Dissolved Solids

PROJECT NARRATIVE

Project: MLF-FALL-2023
Pace Project No.: 30641025

Method: **EPA 350.1**
Description: 350.1 Ammonia, Distilled
Client: Environmental Monitoring and Assessment LLC
Date: December 12, 2023

General Information:
1 sample was analyzed for EPA 350.1 by Pace Analytical Services Greensburg. All samples were received in acceptable condition with any exceptions noted below or on the chain-of custody and/or the sample condition upon receipt form (SCUR) attached at the end of this report.

Hold Time:
The samples were analyzed within the method required hold times with any exceptions noted below.

Sample Preparation:
The samples were prepared in accordance with EPA 350.1 with any exceptions noted below.

Method Blank:
All analytes were below the report limit in the method blank, where applicable, with any exceptions noted below.

Laboratory Control Spike:
All laboratory control spike compounds were within QC limits with any exceptions noted below.

Matrix Spikes:
All percent recoveries and relative percent differences (RPDs) were within acceptance criteria with any exceptions noted below.

Additional Comments:

This report shall not be reproduced, except in full,

PROJECT NARRATIVE

Project: MLF-FALL-2023
Pace Project No.: 30641025

Method: **EPA 410.4**
Description: 410.4 COD
Client: Environmental Monitoring and Assessment LLC
Date: December 12, 2023

General Information:
1 sample was analyzed for EPA 410.4 by Pace Analytical Services Greensburg. All samples were received in acceptable condition with any exceptions noted below or on the chain-of custody and/or the sample condition upon receipt form (SCUR) attached at the end of this report.

Hold Time:
The samples were analyzed within the method required hold times with any exceptions noted below.

Sample Preparation:
The samples were prepared in accordance with EPA 410.4 with any exceptions noted below.

Method Blank:
All analytes were below the report limit in the method blank, where applicable, with any exceptions noted below.

Laboratory Control Spike:
All laboratory control spike compounds were within QC limits with any exceptions noted below.

Matrix Spikes:
All percent recoveries and relative percent differences (RPDs) were within acceptance criteria with any exceptions noted below.

PROJECT NARRATIVE

Project: MLF-FALL-2023
Pace Project No.: 30641025

Method: **EPA 9038**
Description: 9038 Sulfate, Turbidimetric
Client: Environmental Monitoring and Assessment LLC
Date: December 12, 2023

General Information:
1 sample was analyzed for EPA 9038 by Pace Analytical Services Greensburg. All samples were received in acceptable condition with any exceptions noted below or on the chain-of custody and/or the sample condition upon receipt form (SCUR) attached at the end of this report.

Hold Time:
The samples were analyzed within the method required hold times with any exceptions noted below.

Method Blank:
All analytes were below the report limit in the method blank, where applicable, with any exceptions noted below.

Laboratory Control Spike:
All laboratory control spike compounds were within QC limits with any exceptions noted below.

Matrix Spikes:
All percent recoveries and relative percent differences (RPDs) were within acceptance criteria with any exceptions noted below.

Additional Comments:

This data package has been reviewed for quality and completeness and is approved for release.

QUALIFIERS

Project: MLF-FALL-2023
Pace Project No.: 30641025

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Reported results are not rounded until the final step prior to reporting. Therefore, calculated parameters that are typically reported as "Total" may vary slightly from the sum of the reported component parameters.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

SAMPLE QUALIFIERS

Sample: 30641025001

[1]	Sample pH for 8011 is 7

ANALYTE QUALIFIERS

1c	Total dissolved solids results for ASTM Leach cannot be used for compliance purpose
M1	Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.
N3	Accreditation is not offered by the relevant laboratory accrediting body for this parameter.

Notes and Definitions

QM-07	The spike recovery was outside acceptance limits for the MS and/or MSD. The batch was accepted based on acceptable LCS recovery.
O-08	The original extraction of this sample yielded QC recoveries outside acceptance criteria. It was reextracted after the recommended maximum hold time.
J	Detected but below the reporting limit; therefore, result is an estimated concentration (CLP J-Flag).
RE	Sample reanalyses are done at the laboratory's discretion as a mechanism to improve data quality. Any client requested reanalysis will be identified with a sample qualifier.
ND	Analyte NOT DETECTED at or above the reporting limit
dry	Sample results reported on a dry weight basis
RPD	Relative Percent Difference
%-Solids	Percent Solids is a supportive test and as such does not require accredidation

The results in this report apply to the samples analyzed in accordance with the chain of custody document. This analytical report must be reproduced in its entirety.

Notes and Definitions

R-01	The reporting limit for this analyte has been raised to account for matrix interference.
O-04	This sample was analyzed outside the EPA recommended holding time.
J	Detected but below the reporting limit; therefore, result is an estimated concentration (CLP J-Flag).
B	Analyte is found in the associated blank as well as in the sample (CLP B-flag).
RE	Sample reanalyses are done at the laboratory's discretion as a mechanism to improve data quality. Any client requested reanalysis will be identified with a sample qualifier.
ND	Analyte NOT DETECTED at or above the reporting limit
dry	Sample results reported on a dry weight basis
RPD	Relative Percent Difference
%-Solids	Percent Solids is a supportive test and as such does not require accredidation

The results in this report apply to the samples analyzed in accordance with the chain of custody document. This analytical report must be reproduced in its entirety.

Project Number: MLF-ANNUAL-ZONE 3
Project Manager: Steve Brown

Reported:
11/20/23 08:56

Notes and Definitions

O-07	This sample was received outside of the EPA recommended holding time.
J	Detected but below the reporting limit; therefore, result is an estimated concentration (CLP J-Flag).
RE	Sample reanalyses are done at the laboratory's discretion as a mechanism to improve data quality. Any client requested reanalysis will be identified with a sample qualifier.
ND	Analyte NOT DETECTED at or above the reporting limit
dry	Sample results reported on a dry weight basis
RPD	Relative Percent Difference
%-Solids	Percent Solids is a supportive test and as such does not require accredidation

The results in this report apply to the samples analyzed in accordance with the chain of custody document. This analytical report must be reproduced in its entirety.

Notes and Definitions

O-04	This sample was analyzed outside the EPA recommended holding time.
J	Detected but below the reporting limit; therefore, result is an estimated concentration (CLP J-Flag).
I	Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.
RE	Sample reanalyses are done at the laboratory's discretion as a mechanism to improve data quality. Any client requested reanalysis will be identified with a sample qualifier.
ND	Analyte NOT DETECTED at or above the reporting limit
dry	Sample results reported on a dry weight basis
RPD	Relative Percent Difference
%-Solids	Percent Solids is a supportive test and as such does not require accredidation

The results in this report apply to the samples analyzed in accordance with the chain of custody document. This analytical report must be reproduced in its entirety.

Notes and Definitions

J	Detected but below the reporting limit; therefore, result is an estimated concentration (CLP J-Flag).
RE	Sample reanalyses are done at the laboratory's discretion as a mechanism to improve data quality. Any client requested reanalysis will be identified with a sample qualifier.
ND	Analyte NOT DETECTED at or above the reporting limit
dry	Sample results reported on a dry weight basis
RPD	Relative Percent Difference
%-Solids	Percent Solids is a supportive test and as such does not require accredidation

The results in this report apply to the samples analyzed in accordance with the chain of custody document. This analytical report must be reproduced in its entirety.

RE: MILLERSVILLE LANDFILL

Enclosed are the results of analyses for samples received by the laboratory on 11/20/23 15:00.

Please visit our website at www.mdspectral.com for a complete listing of our accreditations.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Will Brewington
President

Notes and Definitions

J	Detected but below the reporting limit; therefore, result is an estimated concentration (CLP J-Flag).
RE	Sample reanalyses are done at the laboratory's discretion as a mechanism to improve data quality. Any client requested reanalysis will be identified with a sample qualifier.
ND	Analyte NOT DETECTED at or above the reporting limit
dry	Sample results reported on a dry weight basis
RPD	Relative Percent Difference
%-Solids	Percent Solids is a supportive test and as such does not require accredidation

The results in this report apply to the samples analyzed in accordance with the chain of custody document. This analytical report must be reproduced in its entirety.

SUBMITTAL COVER SHEET

TO:	Jake Belmonte	**Date:** 19 May 2015	**Job No.:** MQ1125
ADDRESS:	American Infrastructure	**Project:** Millersville Landfill – Subcell 9.1 Construction	
	2011 Belair Road	389 Burns Crossing Road, Severn, Maryland 21144	
	P.O. Box 2787	County Project No. – N530600	
	Fallston, Maryland 21047	County Contract No. – N530605	

Submittal I.D. No.: 10-017	Revision No.: 0	Contractor Submittal No.: 10-017
Specification Section(s): 02290		Date of Submittal Report: 19 May 2015
Submittal Subject: Prepared Subbase Material – On-Site Clay Within the Subcell 9.1 Footprint		

Notations:

- ☒ Accepted as Specified
- ☐ Accepted as Equal to Specified
- ☐ Accepted as Noted
- ☐ Revise and Resubmit
- ☐ Rejected
- ☐ Informational Purposes Only
- ☐ Reviewed, not for Approval

Remarks:

1. Sample Numbers D4S-3 & D4S-4 meet or exceed the prepared subbase material requirements presented in Section 02290 – 2.1, B of the Technical Specifications.
2. Allan Myers, Inc. will ultimately need to submit nine (9) prepared subbase soil samples (six (6) additional samples) for laboratory analysis per Table 1 – 02290, as directed by Section 02290 – 3.1, C, 2 of the Technical Specifications.

Review of this submittal does not relieve the Contractor from their responsibility for deviations from the Contract Documents nor from their responsibility for errors or omissions in the submittal. Contractor is, and Engineer is not, responsible for matters relating to fabrication, shipping, handling, storage, assembly, installation, construction (including safety), and coordination for performing the Work

HYDRAULIC CONDUCTIVITY, ASTM D5084, Method A

Project:	Millersville Landfill - Subcell 9.2
Client:	SCS Engineers
Project Number:	17324-0
Sample ID:	CCL-1 / Bulk
Classification:	Red LEAN CLAY (CL)

LL= 45 PL = 21 Passing #200= 94.4

Date Tested:	6/2/2020	
Average Length	5.47	*inches*
Average Diameter	2.88	*inches*
Initial Moisture Content	20.0%	
Initial Dry Density	121.1	*pcf*
Final B-value (saturation)	>0.95	
Total Back Pressure	100.0	*psi*
Final Moisture Content	23.9%	
Effective Consolidation Pressure	13.9	*psi*
Assumed Specific Gravity	2.650	
Average Test Temp	23.3	*^{o}C*
Final Hydraulic Gradient	27	
*Measured Hydraulic Conductivity at Test Temperature	**1.55828E-07**	*cm/sec*
**Hydraulic Conductivity at Standard Temperature, 20°C	**1.44091E-07**	*cm/sec*

Testing Notes:

** Measured hydraulic conductivity at test temperature based on the last four readings in accordance with ASTM D5084-16a, section 9.5.4.1*

***Hydraulic Conductivity at Standard Temperature in accordance with ASTM D5084-16a, section 10.3*

Test performed at multiple increasing gradients. Data presented shows permeation at final gradient that meets criteria specified in section 9.5.4.2

NT = Not Tested

TEST PAD

HYDRAULIC CONDUCTIVITY, ASTM D5084, Method A

Project:	Millersville Landfill - Subcell 9.2
Client:	SCS Engineers
Project Number:	17324-0
Sample ID:	TP-L1A / ST-1
Classification:	N/A

LL= N/A PL = N/A Passing #200= N/A

Date Tested:	7/29/2020	
Average Length	5.40	*inches*
Average Diameter	2.88	*inches*
Initial Moisture Content	13.9%	
Initial Wet Density	127.7	*pcf*
Initial Dry Density	112.1	*pcf*
Final B-value (saturation)	>0.95	
Total Back Pressure	84.0	*psi*
Final Moisture Content	18.6%	
Effective Consolidation Pressure	10.0	*psi*
Assumed Specific Gravity	2.650	
Average Test Temp	23.3	*^{o} C*
Final Hydraulic Gradient	34	
*Measured Hydraulic Conductivity at Test Temperature	**4.32835E-06**	*cm/sec*
**Hydraulic Conductivity at Standard Temperature, 20°C	**4.00234E-06**	*cm/sec*

Testing Notes:

** Measured hydraulic conductivity at test temperature based on the last four readings in accordance with ASTM D5084-16a, section 9.5.4.1*

***Hydraulic Conductivity at Standard Temperature in accordance with ASTM D5084-16a, section 10.3*

Test performed at multiple increasing gradients. Data presented shows permeation at final gradient that meets criteria specified in section 9.5.4.2

NT = Not Tested

1. INTRODUCTION

1.1 Terms of Reference

This report was prepared for the Anne Arundel County (AAC) Department of Public Works by GeoSyntec Consultants (GeoSyntec). The report was prepared by Ms. Molly Davis and Mr. Kirk Kessler, P.G., and it was reviewed by Mr. Michael Houlihan, P.E., and Dr. Rudolph Bonaparte, P.E, all of GeoSyntec.

1.2 Purpose of Report

The purpose of this report is to present the results of an evaluation of the leachate containment capabilities of the double-liner system design for Cell 9 of the Millersville Sanitary Landfill (MLF). The report demonstrates that the MLF design meets the performance standard established by the U.S. Environmental Protection Agency (USEPA) in Title 40 Code of Federal Regulations Part 258 (40 CFR § 258.40) (i.e., Subtitle D). The report is intended to provide the information necessary for the Maryland Department of the Environment (MDE) and the USEPA to make a determination of the adequacy of the liner system under the provisions of 40 CFR § 258.40(e). These provisions must be used in "unapproved" states when landfill liner system designs other than the prescriptive design of 40 CFR § 258.40(a)(2) are used. The liner system design for Cell 9 of MLF is different than, although in many ways superior to, the prescriptive liner system design in 40 CFR § 258.40(a)(2). As Maryland is presently an unapproved state, the provisions of 40 CFR § 258.40(e) must be met. These provisions are given below.

"*(e) If EPA does not promulgate a rule establishing the procedures and requirements for State compliance with RCRA section 4005(c)(1)(B) by October 9, 1993, owners and operators in unapproved States may utilize a design meeting the performance standard in § 258.40(a)(1) if the following conditions are met:*

(1) The State determines the design meets the performance standard in § 258.40(a)(1);

(2) The State petitions EPA to review its determination; and

(3) EPA approves the State determination or does not disapprove the determination within 30 days."

The information presented in the remainder of this report is intended to allow MDE to make a determination for Cell 9 under 40 CFR § 258.40(e)(1) cited above that the liner system design for Cell 9 satisfies Subtitle D requirements.

1.3 Previous MLF Double-Liner Performance Evaluation

GeoSyntec previously made a demonstration that the MLF double-liner system design satisfies 40 CFR § 258.40(e)(1). The previous demonstration was made in a May 1993 report from GeoSyntec to AAC entitled "*Millersville Sanitary Landfill - Evaluation of the Performance of the Double-Liner System Design for Cells 8 and 9 and Comparison to the USEPA Performance Standard (40 CFR § 258.40(a)(1))*" [GeoSyntec, 1993]. The report presented the results of calculations of leachate migration rates through the MLF double-liner system under assumed operating conditions intended to provide an "upper bound" estimate of leachate migration potential. Conservation assumptions and methodologies were employed in the calculations. The "upper bound" leachate migration rate calculated for the MLF double-liner system is 0.3 liters/hectare/day (lphd) (0.03 gallons/acre/day (gpad)). The May 1993 GeoSyntec report

showed that this calculated rate of leachate migration from the landfill is so small that there is no adverse impact on ground water. In fact, the calculated performance of the MLF double-liner system was found to be 1,000 times better than the performance allowed by 40 CFR § 258.40(a)(1). The May 1993 GeoSyntec report also showed that the MLF double-liner system has liquid containment capabilities superior to those of the "Subtitle D" prescriptive composite liner system described in 40 CFR § 258.40(a)(2).

In September 1993, USEPA issued the "*Interim Final Guidance, Municipal Solid Waste Landfill Liner Petition Process, 40 CFR Part 258.40(e)*" (hereafter referred to as the Interim Final Guidance). The Interim Final Guidance provides recommended procedures for evaluating the performance of liner systems and compliance with the performance criteria of 40 CFR § 258.40(a)(1). In particular, the Interim Final Guidance recommends the use of the USEPA Multimedia Exposure Assessment (MULTIMED) model for simulation of the subsurface transport of leachate constituents to the point of compliance. The approach to establishing compliance with 40 CFR § 258.40(a)(1) in the Interim Final Guidance is essentially the same as that used in the May 1993 GeoSyntec report, with the exception of the use of MULTIMED. GeoSyntec understands that MDE desires to see a demonstration of compliance with 40 CFR § 258.40(a)(1) using the MULTIMED model as described in the Interim Final Guidance. Therefore, this report presents the demonstration requested by MDE. This report compliments the May 1993 performance evaluation report previously prepared by GeoSyntec.

1.4 Contents of Report

The remainder of this report is organized as follows:

- background information on the MLF site and landfill design is presented in Section 2;

- the MLF liner system performance evaluation is described in Section 3; and
- a summary and conclusions are presented in Section 4.

2. BACKGROUND INFORMATION

2.1 Site Location and Description

The MLF site is located about 1.6 km (1 mile) due east of Fort George G. Meade and approximately 1.6 km (1 mile) northwest of Millersville in northern Anne Arundel County, Maryland (see Figure 1). The site is located in the Odenton Quadrangle of the United States Geological Survey (USGS) 7.5 minute map at a latitude of approximately N39°5′30" and a longitude of approximately E76°40′00". The site occupies approximately 567 acres (230 hectares). An intermittent stream, Wells Branch, flows across the site, generally from west to east, becoming perennial at the eastern site boundary. The stream continues to the east until meeting Severn Run, which, in turn, eventually flows into the Severn River.

The site is divided into two sections by a 120 ft-wide Baltimore Gas and Electric (BG&E) right-of-way that is oriented generally west to east across the northern quarter of the site. The northern half of the site has been developed and prior landfilling activities there are completed. The southern half of the site is the location of present and future landfilling activities. A large portion of the southern half of the site is undeveloped and densely wooded or covered with heavy brush. The major undeveloped portion of the site is south of Wells Branch. Elevations at the site range from a low of about 24 m (80 ft) above mean sea level datum at the eastern site boundary along the intermittent stream banks, to a high of about 72 m (240 ft) above mean sea level datum at the southern and western site boundaries.

2.2 Site History

AAC began operations at MLF in January 1975. The initial site development plan was prepared by Century Engineering [1974] and included

ten distinct landfill cells numbered sequentially from Cell 1 to Cell 10. Cells 1 through 4 are located in the northern portion of the site (i.e., north of the BG&E right-of-way), Cells 5 through 8 are located in the center of the site, and Cells 9 and 10 are located in the southern portion of the site.

During the period from 1989 through 1992, GeoSyntec Consultants prepared permit application and construction documents for the MLF site [GeoSyntec, 1989a,b, 1990a,b, 1991, and 1992b]. The permit application documents (i.e., Phase II and Phase III permit modification applications) [GeoSyntec, 1989a and 1991] present a modified site development plan (see Drawing 1 of 3) and a modified design that incorporates the following changes to the original site development plan and design prepared by Century Engineering [1974]:

- original Cells 9 and 10 are combined into a single cell designated as Cell 9;
- a double-liner system and a geomembrane cover system are incorporated into the design of Cells 8 and 9;
- Cells 5, 6, and 7 are combined into a single cell designated as Cell 567; and
- a geomembrane cover system is incorporated into the design of Cell 567.

Cell 9 is the primary focus of the alternative design petition for which this report provides technical support.

2.3 Description of the MLF Liner System

The double-liner system for Cell 9 of the MLF (termed MLF liner system in the remainder of this report) consists of the following components from top to bottom:

- 0.6-m (2-ft) thick protective soil cover;
- geotextile filter layer;
- leachate collection geonet drainage layer;
- 1.5-mm (60-mil) thick high density polyethylene (HDPE) geomembrane top liner;
- leakage detection geonet drainage layer;
- 1.5-mm (60-mil) thick HDPE geomembrane bottom liner; and
- 0.45-m (1.5-ft) thick compacted soil with a hydraulic conductivity of no more than 1×10^{-5} cm/s (2×10^{-5} ft/min).

The leachate collection system for Cell 9 consists of one layer of geonet covering the entire bottom of each landfill subcell and a system of perforated HDPE pipes placed in gravel blankets that overlie the geonet. Leachate is conveyed by the geonet and/or pipes to a sump, from which leachate is pumped and conveyed to an on-site leachate storage facility. The leachate collection system for Cell 9 is designed to keep a very small liquid depth on the top liner (i.e., less than 5.0 mm (220 mil), which is the thickness of the geonet drainage layer) at all locations within a subcell, except at the sump where liquid is collected for pumping. In the sump areas of the landfill, the MLF liner system is enhanced by the addition of layers of geosynthetic clay liner (GCL) below both top and bottom geomembranes. The GCLs have saturated hydraulic

conductivities of less than 1 x 10^{-9} cm/s (2 x 10^{-9} ft/min). The GCLs together with the other liner system components result in a "double-composite" liner system beneath the landfill sumps.

The double-liner system described above design differs from the prescriptive minimum construction standards of 40 CFR § 258.40. In most respects, the Cell 9 liner system design is superior to the prescriptive standards. As previously indicated, however, in unapproved states, the adequacy of any design other than the prescriptive design must be demonstrated in accordance with the provisions of 40 CFR § 258.40(e). These provisions apply even if the capabilities of a given liner system design are clearly superior to the prescriptive minimum construction standards.

2.4 Relevant Operating Scenario

The configuration of Cell 9 can be approximated as being rectangular, as shown on Figure 2. This approximation is necessary to satisfy the one- and two-dimensional flow and transport equations used by MULTIMED. Ground water in the uppermost locally perched aquifer beneath Cell 9 flows in a northerly direction. This perched system is labeled as Zone 2 to distinguish it from deeper and laterally continuous aquifers with different ground-water flow characteristics. The one-dimensional approximation of ground-water flow for the Zone 2 perched aquifer, a requirement for MULTIMED, is shown on Figure 2. The one-dimensional flow dimension is interpreted as being parallel to the short dimension of the landfill boundary.

The sand lens comprising Zone 2 pinches out to the northeast and southwest of Cell 9. This condition is illustrated by the truncation of the potentiometric surface shown on Figure 2. A clay confining unit approximately 9 to 12 m (30 to 40 ft) in thickness separates Zone 2 from the underlying Zone 3 aquifer. Zone 3 exhibits a ground-water flow

direction and gradient that is significantly different than the flow direction and gradient in Zone 2. Flow in Zone 3 is to the east, and under a much lower gradient than Zone 2 (Figure 3).

Two scenarios were considered for the MULTIMED flow and transport simulations performed in preparation of this report. The first scenario depicts the Zone 2 aquifer as being laterally continuous over the entire area of the Cell 9 waste unit. This is a conservative approach in that: (i) a maximum chemical loading is obtained by considering the entire waste management unit; and (ii) a maximum flow pathline length is considered. Zone 3 is modeled in the second MULTIMED scenario. Conservative assumptions were used for this scenario as well, including: (i) maximum chemical loading is obtained by considering the entire waste management unit; and (ii) infiltration from the waste unit is assumed to pass directly to Zone 3, without considering dilution in Zone 2 or attenuation by the clay unit overlying Zone 3.

2.5 Point of Compliance

The relevant point of compliance for a waste management unit is set by the Director of an approved state in accordance with 40 CFR § 258.40(d) or at the waste management boundary in unapproved states. Since Maryland is presently an unapproved state, the relevant point of compliance for the performance demonstration in this report is taken as the downgradient unit boundary. It is noted, however, that this point of compliance is selected for purposes of this report only. An alternative point of compliance may be selected under the provisions of 40 CFR § 258.51(b), for purposes of ground-water monitoring, if approved by MDE, once Maryland becomes an approved state.

The point of compliance utilized in the MULTIMED simulations are conceptualized as the point where the one-dimensional approximated ground-water flow pathline beneath Cell 9 intersects the cell boundary.

Figure 2 shows the point of compliance for the Zone 2 perched aquifer as the northern boundary of the waste management unit. The eastern cell boundary is the point of compliance for the Zone 3 aquifer, as shown on Figure 3.

3. PERFORMANCE EVALUATION OF CELL 9 LINER SYSTEM DESIGN

3.1 Introduction

USEPA has established specific performance criteria for municipal solid waste (MSW) landfills in 40 CFR § 258. Section 258.40(a)(1) describes performance criteria for liner system design which states "*the design must ensure that the concentration values listed in Table 1 of this section are not exceeded*". Table 1 from 40 CFR § 258 is reproduced in this report as Table 1.

The performance evaluation of a proposed liner system design may be performed in two steps. First, an estimate is made of the rate of leachate leakage through the liner system and into the subsurface environment (i.e., infiltration rate in the MULTIMED model). Second, an evaluation is performed of the transport of contaminants to the relevant point of compliance assuming the leakage rate from the first step. Mathematical models are often used in simulating these processes.

As described in Section 1.3 of this report, GeoSyntec previously performed an evaluation of the MLF liner system which included the two steps listed above. With respect to the first step, calculation of the leachate migration rate, GeoSyntec previously used an approach based on the combined application of the Hydrologic Evaluation of Landfill Performance (HELP) model, Version 2.05 [USEPA, 1984a,b], and equations for steady-state leakage through liners described in Bonaparte et al. [1989] and Giroud et al. [1992]. Version 3.0 of the HELP model, currently under development, will directly incorporate these equations for steady-state leakage through liners. Development of Version 3.0 is described in the April 1992 USEPA document "*Draft Technical Manual of Solid Waste Disposal Facility Criteria - 40 CFR Part 258" [USEPA, 1992]*. On page D-6, the report states "*Version 3.0 of the model is under revision and will include an updated method to assess leakage that is based on the research and data conducted by Giroud and Bonaparte*". Since

Version 3.0 was not available for the May 1993 performance evaluation, GeoSyntec used Version 2.05 of the HELP model and manually incorporated the equations of Giroud and Bonaparte in this analysis. Until Version 3.0 becomes available, this remains the best approach for evaluating potential leakage from a landfill unit. Details of these leakage rate calculations are presented in Section 3.2 of this report.

With respect to the second step described above, the May 1993 GeoSyntec report used simple, but conservative, mixing and flow models to simulate leachate dilution in the saturated zone and transport to the point of compliance. At the request of MDE, GeoSyntec has performed new contaminant transport calculations for this report using the Multimedia Exposure Assessment (MULTIMED) model [Salhotra and Mineart, 1988]. The USEPA Interim Final Guidance recommends the use of this particular model in evaluating liner system designs for compliance with Subtitle D performance criteria. An overview of MULTIMED is presented in Section 3.3 and a discussion of model input is given in Section 3.4.

3.2 HELP Modeling Input, Results, and Rate of Leakage

3.2.1 Overview

This section of the report describes the estimation of leachate generation rates and the evaluation of potential leakage rates through the double-liner system that will underlie Cell 9. As described above, the approach taken is to first estimate leachate generation rates using the HELP model and then to estimate potential leachate leakage rates through the MLF double-liner system using equations from the technical literature. As a final step, the calculated rate of leakage through the double-liner system is used as input into the MULTIMED model and the concentrations of leachate at the point of compliance are calculated. All calculations are based on the conservative assumption of steady-state flow conditions.

3.2.2 HELP Modeling Input and Results

The HELP model is a quasi two-dimensional hydrologic model of water movement across, into, through, and out of landfills [Schroeder et al., 1988; USEPA, 1984a,b]. The program accepts climatologic, soil, and design data and uses a solution technique that accounts for the effects of surface storage, runoff, infiltration, percolation, evaporation, soil moisture storage, and lateral drainage.

In the analysis performed for this report, the HELP model was used to estimate the flow of leachate in the LCRS drainage layer. In the model, this was accomplished by assuming that percolation through the geomembrane top liner was zero (i.e., the geomembrane top liner was modeled as an impervious layer). Two scenarios were evaluated with the HELP model based on the following assumptions:

- for the first scenario, one subcell is active; this subcell contains an 2.4-m (8-ft) thick layer of waste and an overlying 0.6-m (0.5-ft) thick daily cover layer;

- for the second scenario, four subcells are inactive; these subcells contain an 24-m (80-ft) thick layer of waste and an overlying 0.3-m (1-ft) thick intermediate cover layer;

- the daily cover is assumed to be bare ground;

- the intermediate cover is assumed to be grass in fair condition;

- for both scenarios, the climatologic data for Baltimore, Maryland, the closest city in the HELP model database to the site, was used; and

- in both scenarios, the LCRS drainage layer is modeled as a soil layer with physical and hydraulic characteristics similar to the actual geosynthetic material comprising the drainage layer.

Other assumptions used in the HELP model are described in Appendix A. Table 2 provides a tabular summary of the HELP model input parameters used in the analyses for this report.

For the scenarios evaluated, calculated peak rates of leachate flow in the LCRS drainage layer (layer 4) ranged from 0.13 to 1.9 mm/day (0.005 to 0.0734 in./day). These values equate to 1,360 lphd (136 gpad) and 19,900 lphd (1,990 gpad), respectively. The larger of these values was combined with equations described in the following section to estimate the liquid head on the geomembrane top liner and the leakage rate through the double-liner system.

3.2.3 Rate of Leakage

Empirical equations are used to estimate steady-state leachate generation rates based on the following approach:

- estimate the liquid head on the top liner;
- estimate the steady-state leakage rate through the top liner;
- estimate the liquid head on the bottom liner caused by leakage through the top liner; and
- estimate the steady-state leakage through the bottom composite liner using the results of the previous steps.

As discussed in Giroud and Bonaparte [1989a,b] and USEPA [1987], leakage through geomembranes (that are properly installed using adequate

construction quality assurance (CQA) procedures during installation), primarily occurs due to occasional, small defects (or holes) in the geomembrane. For purposes of estimating leakage, the previously mentioned references recommend a defect frequency of one to two holes per acre (two to five holes per hectare); two holes per acre (five per hectare) were assumed for purposes of this report. Also as recommended by these references, a defect size of 3.1×10^{-6} m^2 (3.3×10^{-5} ft^2) is assumed for geomembranes installed using CQA procedures in substantial conformance with USEPA [1986] guidance.

For purposes of the leakage rate calculations, the liquid head on the top liner is conservatively assumed to equal the thickness of the geonet (i.e., 5 mm (0.2 in.)). The calculated value of head on the top liner based on the leachate generation rates obtained using the HELP model is less than this values.

The rate of steady-state leakage through the geomembrane top liner (which is underlain by a drainage layer) can be estimated using the following equation [Bonaparte et al., 1989]:

$$Q = 0.6\ a\sqrt{2\ gh_w} \qquad \text{(Equation 1)}$$

where: Q = steady-state rate of leakage through a geomembrane hole (m^3/s or ft^3/s); a = hole area (3.1×10^{-6} m^2 or 3.3×10^{-5} ft^2); g = acceleration due to gravity (9.81 m/s^2 or 32.2 ft/s^2); and h_w = liquid head on top of the geomembrane (0.005 m or 0.017 ft).

The calculated steady-state leakage through a single geomembrane hole is 6×10^{-7} m^3/s (13 gallons per day (gal/day)). For two defects per acre (five per hectare), the calculated steady-state rate of leakage is 260 lphd (26 gpad) through the top liner.

The maximum head on the bottom liner, which occurs immediately below the defect in a geomembrane top liner, can be approximated using the following equation developed by Giroud [1991] and presented in USEPA [1992]:

$$h = \sqrt{Q/k} \qquad \text{(Equation 2)}$$

where: h = head on the bottom liner (m or ft); Q = steady-rate of leakage through a single defect in a geomembrane top liner (m^3/s or ft^3/s); and k = hydraulic conductivity of the leakage detection layer (m/s or ft/s).

The calculated maximum head on the bottom liner, resulting from use of Equation 2, $Q = 6.0 \times 10^{-7}$ m^3/s (2.1×10^{-5} ft^3/s), and k = 0.18 m/s (0.59 ft/s) (as specified in the MLF construction specifications) is 0.002 m (0.006 ft).

The liquid head on the bottom liner calculated using Equation 2 is a maximum value which occurs immediately below a defect in the top geomembrane liner. As the liquid spreads through the leakage detection layer, the head decreases. In fact, it is shown in Giroud [1991] and USEPA [1992] that leakage through a defect in the top liner "wets" only a portion of the leakage detection layer. Therefore, it is highly unlikely that any defect in the geomembrane component of the bottom liner (which is immediately below the leakage detection layer) would be subjected to the maximum head calculated using Equation 2. Moreover, there is a high probability that any defect in the geomembrane component of the bottom liner falls outside the wetted areas, and therefore, is subjected to no head at all. For the purpose of estimating a steady-state leakage rate through the bottom liner, it is conservatively assumed that one defect per acre (two defects per hectare) in the bottom liner is subjected to the maximum head calculated above.

The estimated rate of steady-state leakage through the bottom liner can be estimated using the following equation [Giroud and Bonaparte, 1989b; and USEPA, 1987]:

$$Q = 0.21\ a^{0.1}\ h_w^{0.9}\ k_s^{0.74} \qquad \text{(Equation 3)}$$

where: Q = steady-state rate of leakage through the bottom liner (m^3/s or ft^3/s); a = hole area (m^2 or ft^2); h_w = head on the bottom liner (m or ft); and k_s = hydraulic conductivity of the low-permeability soil component of the bottom liner (m/s or ft/s).

The calculated rate of steady-state leakage through the base slope of the bottom liner, based on a = 3.1×10^{-6} m^2 (3.3×10^{-5} ft^2), h_w = 0.002 m (0.006 ft), and k_s = 1.0×10^{-7} m/s (3.3×10^{-7} ft/s), is 1.45×10^{-9} m^3/s (0.03 gal/day). For a defect frequency of two per hectare (one per acre), the steady-state rate of leakage is 0.3 lphd (0.03 gpad). A calculated rate of leakage through the double-liner system of 0.3 lphd (0.03 gpad) was conservatively used as the infiltration rate for the transport calculations performed in MULTIMED.

3.3 MULTIMED Overview

MULTIMED is a computer model developed by USEPA as a tool for the study and design of Subtitle D land disposal facilities. The model can be used to simulate the transport and transformation of chemical constituents released from the waste disposal facility into the environment. Equations defining flow and transport mechanisms are solved analytically and semi-analytically. The simplifying assumptions required to obtain analytical and semi-analytical solutions restrict the complexity of the systems that can be represented. For example, the model does not account for site-specific spatial variability of aquifer parameters, the shape of the land disposal facility, site-specific

hydrologic boundary conditions, multiple aquifers, or hydrologic stresses (e.g., pumping wells).

The Subtitle D application mode of MULTIMED imposes several restrictions in an effort to develop a conservative approach for simulating leachate migration through the subsurface. These restrictions include:

- only the saturated and/or unsaturated ground-water flow and transport modules may be active in Subtitle D applications; validation has not yet been completed for the surface water, landfill, and air modules; accordingly, these modules may not be used in Subtitle D applications;

- only steady-state transport simulations are permitted for Subtitle D applications; no decay of the source term is allowed, and the contaminant pulse is assumed continuous and constant for the duration of the simulation; and

- the receptor is assumed to be located directly downgradient of the facility, intercepting the center and most concentrated portion of the contaminant plume.

MULTIMED may be used in the design process to evaluate whether a particular landfill design will prevent contaminant concentrations in ground water from exceeding the health-based thresholds stipulated in Subtitle D. Actual constituent concentrations, if known, may be input directly into the model. Most often, constituent concentrations are not known a priori, in which case the input concentration is specified as 1 milligram per liter (mg/l) and a dilution-attenuation factor (DAF) is calculated. This approach is based on the fact that the model estimate of concentration at the point of compliance is linear with respect to the input source concentration. Therefore, the DAF is the factor by which

the constituent concentration decreases along the ground-water flow pathline.

With the input concentration set to 1.0 mg/l, the DAF may be calculated using the constituent concentration predicted by MULTIMED at the point of compliance and the equation:

$$DAF = 1.0/\textit{concentration at the point of compliance} \qquad \text{(Equation 4)}$$

If the DAF is equal to or greater than 100, the liner system design is considered acceptable by USEPA [Sharp-Hansen et al., 1990]. USEPA uses a threshold DAF of 100 to define an acceptable design because the maximum concentrations of constituents expected to exist in Subtitle D landfill leachate is not greater than 100 times the maximum contaminant levels (MCLs) for the constituents in ground water [USEPA, 1990].

MULTIMED may be used in either a deterministic or Monte Carlo framework. In the deterministic framework, all of the ground-water flow and contaminant transport variables are assumed to have a fixed mathematical relationship with each other to completely define the hydrogeologic system. Thus, only one model result is obtained for a given set of input values. A Monte Carlo approach considers the intrinsic randomness and uncertainties inherent in a natural system. If the uncertainties of the input variables are known or can be estimated with a high degree of confidence, then the Monte Carlo method provides a means of evaluating uncertainty in the model results.

The Monte Carlo method can be a useful tool in quantifying model uncertainty, although the method is not without limitation. One difficulty arises in establishing reasonable probability distribution functions for the model parameters, which requires a large amount of data. Probability distribution functions should not merely be assumed, as the certainty of the output is a direct function of the assumed certainty of the input.

3.4 MULTIMED Modeling Input

3.4.1 Overview

Worksheets provided in the USEPA Interim Final Guidance are reproduced in this report to identify specific input parameters and assigned values for the MULTIMED modeling. The reader of this report is referred to Table 3 for input values and justification statements for each parameter discussed in this section of the report.

The deterministic solution was chosen for the MLF site as parameter uncertainty cannot be quantified from the existing database. Unsaturated zone flow and transport were not simulated, rather infiltration through the liner system was assumed to enter the ground-water system directly. This is a conservative approach as it assumes no storage, dilution, or attenuation in the unsaturated zone.

The Subtitle D application mode of MULTIMED specifies the use of a gaussian (i.e., normal distribution) contaminant distribution in the lateral direction at the source model boundary (i.e., the downgradient edge of the waste disposal unit). Uniform mixing is assumed over the vertical mixing or source depth. The maximum dissolved concentration of the contaminant at the source occurs at the center of the gaussian distribution. The standard deviation (σ) is a measure of the width of the source contaminant plume.

Input requirements for the saturated zone transport module may be categorized into three groups:

- source data group parameters;
- aquifer data group parameters; and
- chemical data group parameters.

3.4.2 Source Data Group Parameters

Source data group parameters include:

- leachate infiltration rate from the waste disposal unit;
- area of the waste disposal unit;
- spread (i.e., standard deviation) of the contaminant source;
- recharge rate outside the waste management unit; and
- initial contaminant concentrations.

Infiltration Rate

The infiltration rate is the net amount of leachate that percolates through the liner system into the underlying aquifer. Derivation of an infiltration rate for purposes of MULTIMED modeling was discussed in Section 3.2.3 of this report. As described in Section 3.2.3, the infiltration rate of leakage has been conservatively estimated to be 1.0×10^{-5} m/yr (0.03 gpad).

Area of Waste Disposal Unit

MULTIMED assumes a rectangular orientation for the waste management unit. The length of the unit is oriented by program default in the direction of ground-water flow, and the width is normal to flow. The approximate area of Cell 9 is 341,440 m^2 (85 acres). The length of the facility for the uppermost perched aquifer scenario (Zone 2) was specified as being 320 m (1,050 ft) and the width was specified as 1,067 m (3,500 ft). Flow in Zone 3 is parallel to the longest dimension of the Cell 9. Therefore, the length of the cell for the Zone 3 simulation was

specified as 1,067 m (3,500 ft) and the width was specified as 320 m (1,050 ft).

Spread of Contaminant Source

The standard deviation of the gaussian source contaminant distribution is a measure of the spread of the source [Salhotra et al., 1988]. MULTIMED derives the spread or standard deviation of the gaussian source directly from the width scale of the facility (i.e., the dimension of the facility on horizontal to the ground-water flow direction) according to the equation:

$$\sigma = W/6 \qquad \text{(Equation 5)}$$

where: σ = standard deviation, or spread of contaminant source (m); W = width scale of the facility (m); and the integer six provides a result in which that 99.86 percent of the area under the source is flanked by the width of the facility.

Recharge Rate

Recharge in the model is the net amount of water that percolates into the aquifer outside of the disposal facility. The recharge is assumed to have no contamination and hence serves to dilute the leachate concentration. Recharge was a calibration variable in a past numerical ground-water flow model for the MLF site. The calibrated model used an average recharge rate of 0.13 m/yr (5.3 in./yr) [GeoSyntec, 1990b].

Initial Contaminant Concentration

Subcell 4 of Cell 8, which began receiving waste in October 1992, is the first lined subcell to be operated at MLF. The leachate currently being collected from this subcell is dilute. None of the performance standard constituents listed in Table 1 have been detected. The current leachate quality may not be fully representative of the quality of

leachate that will be collected from lined cells at MLF throughout the life of the facility. For this reason, and to provide conservatism in the liner system evaluation, it is assumed for this report that the quality of leachate from MLF is represented by the median concentration of constituents of interest in leachate as reported in USEPA's 1988 report to Congress on solid waste disposal in the United States [USEPA, 1988a]. The median concentration of leachate constituents from the USEPA report to Congress are presented in Table 4 of this report.

It should be noted, however, that leachate from MLF is expected to have concentrations well below the median concentrations presented in Table 4. This expectation is based on the Subcell 4 leachate analyses showing "non-detects" and the low concentrations detected from samples collected in November 1992 from two wells within unlined cells at MLF (i.e., leachate wells KC1-2 and KC2-3). For comparison, the analytical results from leachate wells KC1-2 and KC2-3 are also presented in Table 4.

The expectation that leachate from MLF will have constituent concentrations below those given in Table 4 is also consistent with recent information provided by USEPA. On 9 October 1991, the agency stated in the federal register (46 FR 50982): "*Furthermore, the Agency has many reasons to believe that the quality of the leachate from MSWLFs will improve over time. Increasingly, communities are instituting household hazardous waste programs and removing toxics from waste prior to its disposal in a municipal landfill. In addition, the Agency expects there to be positive changes in leachate resulting from the 1986 lowering of the cut-off levels for small quantity generator waste and the addition of new RCRA hazardous waste listing and characteristics*".

The MULTIMED model response is linear with respect to calculating concentrations at the point of compliance from the initial leachate concentration at the facility. For this reason, an initial concentration of 1.0 mg/l was specified. As previously described, using this approach,

the model calculates the inverse of a dilution factor as the point of compliance concentration. The dilution factor may then be multiplied by the estimated leachate concentrations from Table 4, or actual analytical results from the two leachate wells KC1-2 and KC2-3.

3.4.3 Aquifer Data Group Parameters

Model Parameters

Parameters within this data group include:

- type of contaminant source geometry (only gaussian is available for Subtitle D applications);
- porosity of the aquifer;
- bulk density of the aquifer material;
- aquifer thickness;
- source thickness (i.e., mixing zone depth);
- ground-water seepage velocity;
- dispersivities (longitudinal, transverse, vertical);
- retardation coefficient; and
- radial distance from the facility to the point of compliance.

Conceptual Hydrogeologic Model

As a prelude to a discussion of specific input parameters, the following narrative provides the conceptual hydrogeologic setting and conditions.

The site geology and hydrogeology is discussed in detail in several reports prepared by GeoSyntec (e.g., [GeoSyntec, 1989a, 1990b, 1992a,c]) and is summarized herein. The MLF site is underlain by unconsolidated sediments, consisting of stratified layers of sand, gravel, silt, and clay overlying consolidated crystalline basement rocks. Four water-bearing zones, Zone 1 through Zone 4, have been identified in the upper 90 m (300 ft) of the unconsolidated sediments at the site. Potentiometric surface maps developed for the four zones were presented in a report prepared by GeoSyntec [1992c].

Ground-water monitoring wells or piezometers have been installed within each water-bearing zone in the subsurface beneath the MLF. In the uppermost zone (Zone 1), ground water is unconfined in primarily fluvial sands and perched on the upper confining layer. The areal extent of Zone 1 is restricted to the southern and southwestern boundaries of the site, north of Discus Mill Road, and along Burns Crossing Road, respectively. The second water bearing zone (Zone 2) occurs in a series of disconnected shallow sand zones within the upper confining layer at the site. In the southern part of the site, Zone 2 may be either unconfined or confined, and is recharged directly from the overlying perched aquifer (i.e., Zone 1). The third water-bearing zone (Zone 3) is a deeper sand zone within the upper confining layer that may be either semi-confined or confined across the site. Zone 3 is used as a residential water supply by some of the homes within 0.8 km (0.5 miles) of the site. This zone is recharged by leakage from the overlying zones (i.e., Zones 1 and 2). The fourth water-bearing zone (Zone 4) is the major ground-water aquifer in the vicinity of the MLF. This aquifer is confined at MLF by a basal clay unit in the upper confining layer.

The hydrogeologic conditions in the vicinity of Cell 9 are shown in Figure 4. This cross section shows the base of Cell 9 is underlain by alternating sand and clay sequences. A portion of the Zone 2 aquifer intersects the waste unit in the central and southern areas beneath Cell 9. Zone 2 is approximately 3 m (10 ft) thick at this location. A continuous clay layer, approximately 9 to 12 m (30 to 40 ft) in thickness underlies Cell 9 and the Zone 2 aquifer. This clay layer provides an effective barrier to vertical contaminant migration into the Zone 3 aquifer. However, the second MULTIMED modeling scenario assumes direct infiltration from the waste unit into Zone 3 as an absolute worst case scenario. For modeling purposes, the Zone 3 aquifer is assumed to be 21.3 m (70 ft) thick.

The direction of ground-water flow beneath Cell 9 in Zone 2 is shown on the potentiometric map for May 1992 (see Drawing 2 of 3). Based on the potentiometric surface shown in Drawing 2, the flow direction in Zone 2 beneath Cell 9 is to the north. MULTIMED can only accommodate a ground-water flow direction normal to the width of the facility (one-dimensional); accordingly, the flow direction for modeling purposes was conceptualized as being normal to the downgradient facility boundary (see Figure 2). The modeled Zone 2 flow direction closely approximates the direction interpreted from the potentiometric map. Ground water in Zone 3 flows to the east, approximately parallel to the long dimension of the Cell boundary as shown on the May 1992 potentiometric surface map (see Drawing 3). Figure 3 shows the one-dimensional MULTIMED approximation of the Zone 3 flow direction.

Aquifer Porosity

Porosity is a factor in the derivation of the contaminant retardation coefficient, although it becomes an incidental variable when modeling contaminant transport under steady-state conditions (assuming no biodegradation). Porosity is also used by MULTIMED to compute the ground-water seepage velocity, and is not considered when seepage

velocity is entered directly in the program. A value of 0.3 (i.e., 30 percent) was used to represent the fine sand aquifer of zone 2.

Bulk Density

Bulk density is another factor used in the calculation of the contamination retardation coefficient. Morris and Johnson [1967] and Mills et al. [1985a,b] report range and mean bulk density of many types of unconsolidated and consolidated geologic materials, with a reported mean bulk density of 1.55 grams per cubic centimeter (g/cc) (96.8 lb/ft^3) for fine sand.

Aquifer Thickness and Mixing Zone Depth

The aquifer thickness of Zone 2 varies within the area of the modeled disposal facility, with an assumed thickness for modeling of 3 m (10 ft). The assumed thickness of Zone 3 is 21.3 m (70 ft). Leakage of leachate through the bottom liner and into the underlying aquifer results in the development of a contaminant mixing zone beneath the waste management unit. The mixing zone depth is derived by MULTIMED using the vertical dispersivity, length scale of the facility, aquifer thickness, ground-water seepage velocity, and leachate infiltration rate.

Hydraulic Conductivity, Hydraulic Gradient, and Seepage Velocity

The average ground-water seepage velocity derived from the previously reported numerical model for Zone 2 is 0.13 m/day (0.4 ft/day) [GeoSyntec, 1990b]. A hydraulic conductivity of 7×10^{-3} cm/s (1.4×10^{-2} ft/min) was utilized in the seepage velocity derivation. The Zone 2 and Zone 3 aquifers are similar in lithology and hydrologic characteristics. Both aquifers are assigned a hydraulic conductivity of 7×10^{-3} cm/s (1.4×10^{-2} ft/min). Hydraulic gradients for Zones 2 and 3, approximated from the May 1992 potentiometric surface maps, are 0.075 and 0.005, respectively. Therefore, seepage velocity for Zone 2 is higher than

Zone 3 owing to a higher gradient. The velocities computed using the hydraulic conductivities, gradients, and porosity reported above are 550 m/yr (4.9 ft/day) for Zone 2 and 36.7 m/yr (0.3 ft/day) for Zone 3 in the region of Cell 9.

Dispersivities

The aquifer longitudinal, transverse, and vertical dispersivities create mechanical dispersion, or spreading, of the simulated contaminant plume. Values for the dispersivity coefficients are difficult to determine, and research has shown dispersivity coefficients are strongly scale dependent [EPRI, 1985]. In the absence of user-specified values, MULTIMED is capable of deriving dispersivity as a fraction of the distance to the downgradient point of compliance; the derivation option was chosen for the MLF site as dispersivity coefficient values are not known. Dispersivities (α) are calculated as follows:

$$\alpha_L = 0.1\ X_r \qquad \text{(Equation 6)}$$

$$\alpha_T = \alpha_L/3.0 \qquad \text{(Equation 7)}$$

$$\alpha_V = 0.056\ \alpha_L \qquad \text{(Equation 8)}$$

where: α_L is the longitudinal dispersivity (m); X_r is the distance to the receptor well (i.e., point of compliance) (m); α_T is the transverse dispersivity (m); and α_v is the vertical transverse dispersivity (m). In the simulations presented herein, X_r is assumed to be the length of the waste management unit in the idealized ground-water flow direction.

Retardation Coefficient

Retardation refers to the ability of a natural ground-water system to adsorb contaminants carried by ground water and thus retard plume migration. The retardation factor (R_s) is derived by MULTIMED from the following equation:

$$R_s = 1 + \rho K_d/\theta \qquad \text{(Equation 9)}$$

where: R_s = retardation factor (dimensionless); ρ = bulk density of the aquifer (g/cc); K_d = contaminant distribution coefficient (cc/g); and θ = saturation water content or porosity (dimensionless). Values for bulk density and porosity were given previously in this section of the report. The contaminant distribution coefficient is discussed subsequently in Section 3.4.4.

A retardation value of one means the contaminant is not adsorbed by the aquifer materials but migrates an a conservative tracer.

Aquifer Temperature, pH, and Organic Carbon Content

Aquifer temperature, pH, and fractional organic carbon content (f_{oc}) are utilized by MULTIMED to estimate various chemical-specific parameters discussed in the following sections. Temperature and pH within Zones 2 and 3 vary within similar ranges. Values for pH and temperature were estimated at 6.8 and 11.7°C, respectively, from well development records. The value of f_{oc} was assumed to be 0.1 percent. This value is based on soil descriptions from on-site drilling activities and on data presented in the technical literature [Dragun, 1988].

Distance to Relevant Point of Compliance

The relevant point of compliance for a waste management unit is set by the Director of an approved state in accordance with 40 CFR § 258.40(d) or at the waste management unit boundary in unapproved states. Since Maryland is an unapproved state effective 9 October 1993, it is assumed that the relevant point of compliance will be at the unit boundary. An arbitrary distance between the waste management boundary and the point of compliance equal to 1 m (0.3 ft) was used in the MULTIMED modeling. This distance was assumed for the MULTIMED

simulations because mathematical instability problems may occur in the simulations when the distance between the waste management unit boundary and the point of compliance is very small. MULTIMED simulations made with varying point of compliance distances indicate the results are insensitive with input values of approximately 5 m (1.5 ft) or less.

3.4.4 Chemical Data Group Parameters

MULTIMED requires the user to input the following coefficients for each selected chemical constituent:

- overall chemical decay coefficient;
- chemical distribution coefficient; and
- biodegradation coefficient.

Five chemicals from Table 1 were chosen, based on criteria described later in Section 3.5.2 of this report. The chosen chemicals are benzene, 1,4-dichlorobenzene, trichloroethylene, vinyl chloride, and carbon tetrachloride. These selected constituent produce the minimum DAFs in the MULTIMED analysis. An explanation of each coefficient and the values assigned for each constituent follows.

Overall Chemical Decay Coefficient

The overall chemical decay coefficient is the rate, in units of $time^{-1}$, at a which a constituent decays in a particular environment. The overall chemical decay coefficient is a function of the hydrolysis rate constants of the constituent only and does not include biological decay. For constituents which are easily biodegraded, hydrolysis may be insignificant relative to biodegradation. Values of the overall chemical decay coefficient for each constituent were not available in the

technical literature. Empirical equations are available in the technical literature to calculate the overall chemical decay coefficient based on the acid, base, and neutral hydrolysis decay coefficients, and the temperature and pH of the aquifer [Dragun, 1988].

The overall chemical decay coefficients of the selected constituents were set to zero in the respective model runs. This is a reasonable assumption as benzene and vinyl chloride do not decay into any hydrolyzable groups [Howard et al., 1991a,b]. Decay due to hydrolysis is insignificant as compared to biodegradation for carbon tetrachloride, trichloroethylene, and 1,4-dichlorobenzene [Howard, 1990].

Chemical Distribution Coefficient

The chemical distribution coefficient, K_d, is also referred to in the technical literature as the sorption coefficient [Dragun, 1988]. Sorption refers to the accumulation of a constituent in the boundary region of a solid-liquid interface [USEPA, 1990]. Sorption tends to retard the transport of a constituent in the subsurface. The value of the chemical distribution coefficient is expressed in units of milliliter per gram (ml/g) and is often calculated based on the following equation:

$$K_d = K_{oc} \times f_{oc} \qquad \text{(Equation 10)}$$

where: K_d = chemical distribution coefficient (ml/g); K_{oc} = normalized distribution coefficient for organic carbon (ml/g); and f_{oc} = fractional organic carbon content of the soil in the saturated zone (dimensionless). It should be noted that this relationship assumes that hydrophobic binding dominates the sorption process.

Values of K_{oc} are readily available in the technical literature for the selected constituents [USEPA, 1988b]. The values of K_{oc} and calculated K_d values for the five constituents are as follows:

Constituent	K_{oc} (ml/g)	K_d (ml/g)
Benzene	83	0.083
1,4-Dichlorobenzene	1,700	1.700
Trichloroethylene	126	0.126
Vinyl Chloride	57	0.057
Carbon Tetrachloride	110	0.11

Biodegradation Coefficient

The biodegradation coefficient, K, describes the rate at which an organic constituent degrades by biotic reactions. In the technical literature, the biodegradation coefficient is often related to the half-life of the constituent. The half life is defined as the time needed for half of the concentration of a constituent to react in a particular medium [Dragun, 1988]. The biodegradation coefficient is calculated based on the following equation:

$$K = 0.693 \ / \ t_{1/2} \qquad \text{(Equation 11)}$$

where: K = the biodegradation coefficient (1/yr); $t_{1/2}$ = the half life of the constituent (yr). Equation 11 is not dimensionally homogenous and must be used with the indicated units.

For the constituents of concern, data pertaining to the half life for each constituent is readily available in the technical literature [Dragun, 1988]. In a particular medium, the half life is often expressed as a range of values depending on how the data were obtained. For the five considered chemicals, the reported half lives and calculated biodegradation coefficients are as follows.

Constituent	Half Life (year)	Biodegradation Coefficient ($year^{-1}$)
Benzene	0.186 - 0.301	2.30 - 3.73
1,4-Dichlorobenzene	0.301	2.30
Trichloroethylene	0.822	0.84
Vinyl Chloride	0.077	9.00
Carbon Tetrachloride	0.019	36.50

3.5 MULTIMED Modeling Results

3.5.1 No Biodegradation

For the first scenario modeled using MULTIMED, the beneficial effects of contaminant biodegradation and retardation were conservatively neglected. These factors may have a significant effect in reducing contaminant concentrations at the point of compliance. In addition, steady-state ground-water flow and transport conditions were also assumed. The first modeling scenario therefore results in the highest predicted contaminant concentrations at the point of compliance.

Using an input concentration of 1.0 mg/l, MULTIMED predicts the point of compliance concentration for the Zone 2 simulation to be 1.547×10^{-5} mg/l. The model predicts the Zone 3 concentration to be 1.089×10^{-4} mg/l (see MULTIMED output, Appendix B). The DAFs are the reciprocals of these values. Zone 2 yields a DAF of approximately 64,600, and Zone 3 yields a DAF of approximately 9,200. Both results are substantially greater than USEPA's minimum threshold DAF of 100. On the basis of these conservative analysis results, the design of Cell 9 satisfies Subtitle D ground-water protection performance criteria.

Table 5 presents predicted concentrations of leachate constituents at the point of compliance when the DAF for the Zone 2 simulation is applied to the median leachate constituent concentrations reported in USEPA [1988a]. The resultant point of compliance concentrations are well below the MCL performance standard for each chemical, supporting the DAF conclusion of an acceptable design. Similarly, the predicted point of compliance concentrations for the Zone 3 simulation, using the USEPA median concentrations data, are shown in Table 6 to be at least several orders of magnitude below the MCL performance standards.

3.5.2 Biodegradation

The impact of chemical biodegradation on the point of compliance leachate concentrations was considered using MULTIMED. For the simulation, all input parameters, except biodegradation parameters, were duplicated from the no-biodegration case. The purpose of the simulation was to evaluate the effect of biodegradation on point of compliance concentrations of select chemicals potentially present in leachate. Five chemicals were chosen for the evaluation based on two criteria: (i) four of the chemicals have been detected on-site in inactive, unlined disposal cells; and (ii) the chemicals pose the lowest margin of safety under the no-biodegradation case. The five chemicals chosen are:

- benzene;
- 1,4-dichlorobenzene;
- trichloroethylene;
- vinyl chloride; and
- carbon tetrachloride.

The predicted chemical concentrations at the point of compliance are lower for the scenario where biodegradation is taken into account compared to the scenario with no biodegradation (see MULTIMED output, Appendix B). This result is expected since biodegradation tends to reduce the concentrations of the chemicals over time. Table 7 compares predicted point of compliance concentrations with the Zone 2 simulation from both scenarios (no-biodegradation and biodegradation), considering both median concentrations of the five chemicals from USEPA [1988a] as well as concentrations of the five chemicals from wells KC1-2 and KC2-3 completed in the older, unlined cells at MLF. The results shown in Table 7 clearly indicate the predicted concentrations are below MCLs by several orders of magnitude. Table 8 compares both cases for the Zone 3 simulation. Again, the predicted concentrations are below MCLs by several orders of magnitude.

3.5.3 Sensitivity Analysis

Analyses were performed to test the sensitivity of several MULTIMED input parameters to model output.

Recharge

The recharge was varied ±50 percent about the baseline of 0.13 m/yr (5.1 in./yr). Comparison of the DAF for the baseline and sensitivity runs is shown below:

	DAF Zone 2	DAF Zone 3
Baseline	64,600	9,200
Increased Recharge	64,600	9,200
Decreased Recharge	64,600	9,200

Results clearly indicate the lack of sensitivity of variations in recharge to the point of compliance results.

Ground-Water Seepage Velocity

Ground-water seepage velocity was also varied ±50 percent about the baseline input value of 550 m/yr (4.9 ft/day) for Zone 2 and 36.7 m/yr (0.3 ft/day) for Zone 3. Results are summarized below:

	DAF Zone 2	DAF Zone 3
Baseline	64,600	9,200
Increased Seepage Velocity	97,000	13,800
Decreased Seepage Velocity	32,300	4,600

The sensitivity analysis shows that the resulting point of compliance is directly proportional to the seepage velocity for both the Zone 2 and Zone 3 simulations. For example, a 50 percent decrease in seepage velocity results in a 50 percent decrease in the DAF. Thus, the design will be acceptable even when considering a one-order magnitude decrease in the seepage velocity, which would be an absolute lower bound for this input parameter.

Organic Carbon Content

The fractional organic carbon content is used by MULTIMED to derive the retardation coefficient. Therefore, this parameter factors into the MULTIMED solution only when biodegradation processes are considered. The chemical benzene was selected for the sensitivity analysis, which was performed by increasing and decreasing the organic carbon content by one order of magnitude about the baseline of 0.001 (0.1 percent). A summary of the sensitivity analysis results is presented below:

	DAF Zone 2	DAF Zone 3
Baseline	65,200	10,400
f_{oc} Increased 10x	66,700	14,300
f_{oc} Decreased 10x	65,000	10,000

The case considering a higher fractional organic carbon content results in a larger dilution-attenuation factor as a result of an increased retardation coefficient.

Bulk Density

Bulk density is another factor used to calculate the retardation coefficient. Benzene was again selected for the evaluation of sensitivity to bulk density. Bulk density was varied about the minimum and maximum range typical for unconsolidated sediments (1.0 g/cc and 2.0 g/cc, respectively). The baseline value used in the MULTIMED simulations was 1.55 g/cc (96.8 lb/ft^3). Results are summarized below.

	DAF Zone 2	DAF Zone 3
Baseline	65,200	10,400
Bulk Density 1.00	65,100	10,200
Bulk Density 2.00	65,200	10,500

Higher bulk density translates into a higher retardation coefficient, and thus a higher DAF.

Summary of Sensitivity Analysis

Several of the input parameters used in the MULTIMED program were varied about plausible ranges of potential values that may exist in the subsurface environment. The results of the analysis show the model is relatively insensitive to these variations. All cases considered show a large margin of safety with respect to the calculated DAF.

The computed point of compliance concentration is approximately linearly proportional to the input infiltration rate (i.e., leakage rate) from the waste management unit. Conservative assumptions were considered in the calculation of the infiltration rate used in the MULTIMED modeling exercise. Even with these conservative assumptions, the modeling demonstrates that the Cell 9 design provides a large margin of safety with respect to the calculated DAF. Less conservatism is the infiltration rate calculations would result is an even higher margin of safety.

4. SUMMARY AND CONCLUSIONS

The purpose of this report is to demonstrate that the liner system design for Cell 9 of the Millersville Sanitary Landfill meets the performance criteria established by the USEPA in 40 CFR § 258.40(a)(1). The demonstration provided in this report is consistent with the approach recommended by USEPA in the document "*Interim Final Guidance, Municipal Solid Waste Landfill Liner Petition Process, 40 CFR § 258.40(e)*". The performance evaluation included the following elements:

- using the HELP model combined with equations from the technical literature to calculate a steady-state leachate migration rate through the double-liner system beneath Cell 9;
- estimating potential leachate constituent concentrations;
- developing the conceptual hydrogeologic framework for the Cell 9 area;
- establishing the point of compliance;
- using the MULTIMED model to simulate the flow and transport of leachate contaminants in the two uppermost aquifer systems;
- calculating constituent concentrations at the point of compliance; and
- comparing the constituent concentrations at the point of compliance to established USEPA criteria.

For the Cell 9 liner system, a conservative steady-state rate of leachate migration of 0.3 lphd (0.03 gpad) was calculated. Conservative leachate constituent concentrations were assumed for the site based on

data for older landfills presented in USEPA [1988a]. The hydrogeologic framework and point of compliance were established for Cell 9 data developed from previous investigations at the site. Two aquifers, identified as Zone 2 and Zone 3, were considered separately in the analysis. Based on the foregoing, a leachate dilution factor was calculated and constituent concentrations were estimated at the point of compliance. The results of the calculations are given in Tables 5 to 8. The calculated concentrations of leachate constituents at the point of compliance are at least three orders of magnitude less than the USEPA water-quality criteria, even under the most conservative set of assumptions. Therefore, the Cell 9 liner system design satisfies the performance criteria of 40 CFR § 258.40(a)(1) with a large margin of safety.

TABLE 1

MCL CONCENTRATION VALUES OF CONSTITUENTS FROM TABLE 1 OF 40 CFR § 258.40

Chemical	MCL[1] (μg/l)
Arsenic	50
Barium	1,000
Benzene	5
Cadmium	10
Carbon tetrachloride	5
Chromium (Hexavalent)	50
2,4-Dichlorophenoxy acetic acid	100
1,4-Dichlorobenzene	75
1,2-Dichloroethane	5
1,1-Dichloroethylene	7
Endrin	0.2
Fluoride	4,000
Lindane	4
Lead	15[2]
Mercury	2
Methoxychlor	100
Nitrate	10,000
Selenium	10
Silver	50
Toxaphene	5
1,1,1-Trichloroethane	200
Trichloroethylene	5
2,4,5-Trichlorophenoxy acetic acid	10
Vinyl Chloride	2

Notes: (1) MCL - Maximum Contaminant Level

(2) The lead MCL concentration used in Table 1 is from "*Drinking Water Regulations and Health Advisories*" issued by the USEPA Office of Water in November 1992. This MCL concentration is less than the MCL concentration in 40 CFR § 258 and provides for a more conservative evaluation.

TABLE 2

ALTERNATIVE LINER DESIGN MODELING INPUT PARAMETERS
LANDFILL MODEL INPUT PARAMETERS

LANDFILL MODEL INPUT PARAMETERS	VALUE	JUSTIFICATION
CLIMATOLOGICAL DATA State of interest	Maryland	
City of interest	Baltimore	Closest city in database to the site
Source of rainfall data	HELP Model	City of interest contained in model database
Source of normal mean monthly temperature data	HELP Model	Temperature data contained in model database
Maximum leaf area index: 0.1 - Bare ground 3.3 - Good grass 2.0 - Poor grass 5.0 - Excellent grass 2.0 - Fair grass	1.0	Intermediate cover conditions
Evaporative zone depth (in.)	21	
Growing season - Enter starting day and ending day (between 1 and 365)	113-298	Growing season (julian date)
SOILS AND DESIGN DATA Source of soil characteristics data	HELP Model	HELP model default values
Number of layers in landfill	5	

TABLE 2 (continued)

LANDFILL MODEL INPUT PARAMETERS	VALUE	JUSTIFICATION
LAYER NO: (make additional copies as needed)	1	
Thickness (in.)	12	Intermediate cover (compacted soil)
Layer type: 1 - Vertical percolation layer 2 - Lateral drainage layer 3 - Barrier soil liner 4 - Barrier soil liner with an FML	1	
Soil texture:	10	
Is this layer compacted? (yes/no)	yes	
If liner layer, enter fraction of daily percolation through barrier (values range from 0.01 to 0.00001)

TABLE 2 (continued)

LANDFILL MODEL INPUT PARAMETERS	VALUE	JUSTIFICATION
LANDFILL COVER DATA Type of vegetative cover Default HELP values for type of vegetative cover: 1 - Bare ground 4 - Good grass 2 - Poor grass 5 - Excellent grass 3 - Fair grass	3	
Runoff curve number (between 0 and 100)	95	
Active (uncovered) landfill? (yes/no)	yes	
Percent of surface runoff that drains from landfill	1.0	
Surface area of landfill (ft^2)	43,560	
Slope of lateral drainage layer(s) (in percent)	3.6	
Maximum horizontal drainage distance (ft)	340	
OUTPUT Average precipitation rate (in./yr) (Use for recharge rate in ground-water transport model)	39.31	
Average percolation rate (in./yr) (Use for infiltration rate in ground-water transport model)	0	No leakage through geomembrane liner, results in 0.002 m of head on liner; therefore, one geonet layer was used to design drainage layer (thickness geonet = 0.004 m > 0.002 m (required))
Average percolation rate (in./yr)	0.4×10^{-3}	Based on 2 holes in geomembrane liner per acre using equation developed by Bonaparte et al., [1989]

TABLE 3

GROUND-WATER TRANSPORT MODEL INPUT PARAMETERS

GROUND-WATER TRANSPORT MODEL INPUT PARAMETER	VALUE	JUSTIFICATION
GENERAL - DEFINE THE OVERALL SYSTEM Run title		
Run option (deterministic or Monte Carlo)	Deter.	Insufficient data on parameter uncertainty for M.C.
Transient or steady-state scenario (Subtitle D default scenario is steady-state)	S.S.	Subtitle D application
UNSATURATED ZONE FLOW PARAMETERS (Attach additional information if appropriate)	N/A	Assume vadose zone transport is negligible
UNSATURATED ZONE TRANSPORT PARAMETERS (Attach additional information if appropriate)	N/A	---
AQUIFER/SATURATED ZONE PARAMETERS: DEPTH/PARTICLE CHARACTERISTICS OF AQUIFER Particle diameter (cm)	NA	Use of porosity data preferred
Porosity of aquifer (--)	0.3	Estimated value from GeoSyntec Ground-Water Investigation Report 7/90
Bulk density (g/cc)	1.55	Mean value for f. sand Table 6-11 MULTIMED manual
Aquifer thickness (m)	3.0 (10 ft)	Average thickness of Zone 2 in Cell 9 area
	21.3 (70 ft)	Average thickness of Zone 3 in Cell 9 area
Mixing zone depth (source thickness)	N/A	Derived from other model input
Type of source of Saturated Zone Module (Gaussian or Patch source)	G	Subtitle D application

TABLE 3 (continued)

GROUND-WATER TRANSPORT MODEL INPUT PARAMETER	VALUE	JUSTIFICATION
HYDRAULIC AND DISPERSION RELATED PARAMETERS		
Hydraulic conductivity (m/yr)	7×10^{-3} cm/sec = 2,200 m/yr	Average of reported field tested range 1.8×10^{-4} to 1.4×10^{-2} cm/sec
Hydraulic gradient (m/m)	0.075	Derived from Zone 2 May 1992 potentiometric surface map in area of Cell 9
	0.005	Derived from Zone 3 May 1992 potentiometric surface map in area of Cell 9
Seepage velocity (m/yr)	Derived	Allow MULTIMED to derive from other input
Retardation coefficient (--)	Derived	Allow MULTIMED to derive from other input
Longitudinal dispersivity (m)	Derived	Derived from flow path (X_r) length of 1 m and formula: $\alpha_L = 0.1\ X_r$ [Sec. 0.5.10, equation 6.12 MULTIMED]
Transverse dispersivity (m)	Derived	$\alpha_T = \alpha_L/3.0$
Vertical dispersivity (m)	Derived	$\alpha_V = 0.056\alpha_L$

TABLE 3 (continued)

GROUND-WATER TRANSPORT MODEL INPUT PARAMETER	VALUE	JUSTIFICATION
MISCELLANEOUS PARAMETERS - TEMPERATURE, PH, AND ORGANIC CARBON OF AQUIFER Temperature of aquifer (°C)	11.7°	Mean value from well development (final values) data wells 8A, 9A, 15B, 18, 19 in 7/90 GW Report
pH of aquifer (pH units)	6.8	Log mean from well data above
Organic carbon content (fraction) (--)	0.001	Estimated from Dragun [1988]
WELL-RELATED PARAMETERS Radial distance from site to receptor (m)	1 m	Minimum distance for program mathematical stability
Angle off plume centerline (degrees) (set to 0 by MULTIMED for Subtitle D application)	0	Subtitle D application
Z-dist, well vertical distance from the water table (m) (set by 0 to MULTIMED for Subtitle D application)	0	Subtitle D application

TABLE 3 (continued)

GROUND-WATER TRANSPORT MODEL INPUT PARAMETER	VALUE	JUSTIFICATION
SOURCE - CONTAMINANT SOURCE Infiltration rate (m/yr) (output from HELP or other landfill model)	2.8×10^{-8} m/d or 1.0×10^{-5} m/yr	Calculated liner leakage rate assumed detection frequency one per acre = 0.03 gpad: value used in previous performance evaluation
Area of waste disposal unit (m^2) (same value used in HELP or other landfill model)	341,440	Total Cell 9 = 85 ac
Spread of contaminant source (m)	Derived	
Recharge rate (m/yr) (output from HELP or other landfill model)	0.13	Average recharge rate from calibrated numerical flow model (7/90 report)
Initial concentration at landfill (mg/l) (set to 1 for Subtitle D application)	1.0	Subtitle D application

TABLE 3 (continued)

GROUND-WATER TRANSPORT MODEL INPUT PARAMETER	VALUE	JUSTIFICATION
CHEMICAL PROPERTIES OF CONTAMINANT		
Name - specify chemical to be modeled (use conservative assumption for a non-degrading chemical)	Benzene	--
DECAY COEFFICIENTS (SOLID, DISSOLVED, OVERALL)		
Solid phase decay coefficient (1/yr) (use conservative assumption for a non-degrading chemical)	N/A	Overall chemical decay calculation determined/specified directly
Dissolved phase decay coefficient (1/yr) (use conservative assumption for a non-degrading chemical)	N/A	Overall chemical decay calculation determined/specified directly
Overall chemical decay coefficient (1/yr) (use conservative assumption for a non-degrading chemical)	0	Benzene has no hydrolyzable groups
HYDROLYSIS RATE CONSTANTS AND REFERENCE TEMPERATURE		
Acid catalyzed hydrolysis rate (l/m-yr) (use conservative assumption for non-degrading chemical)	N/A	Overall chemical decay calculation determined/specified directly
Neutral hydrolysis rate constant (1/yr) (use conservative assumption for non-degrading chemical)	N/A	Overall chemical decay calculation determined/specified directly
Base catalyzed hydrolysis rate (l/m-yr) (use conservative assumption for non-degrading chemical)	N/A	Overall chemical decay calculation determined/specified directly
Reference temperature (°C)	N/A	Overall chemical decay calculation determined/specified directly
Biodegradation factor	2.30 - 3.73 (use 3.2)	$t_{1/2}$ = 68-110 days based on naturally occurring soil-ground-water system and estimate base on field observation; use 84 days as average [Dragun, 1988]

TABLE 3 (continued)

GROUND-WATER TRANSPORT MODEL INPUT PARAMETER	VALUE	JUSTIFICATION
CHEMICAL PROPERTIES OF CONTAMINANT Name - specify chemical to be modeled (use conservative assumption for a non-degrading chemical)	1,4-Dichlorobenzene	--
DECAY COEFFICIENTS (SOLID, DISSOLVED, OVERALL) Solid phase decay coefficient (1/yr) (use conservative assumption for a non-degrading chemical)	N/A	Overall chemical decay calculation determined/specified directly
Dissolved phase decay coefficient (1/yr) (use conservative assumption for a non-degrading chemical)	N/A	Overall chemical decay calculation determined/specified directly
Overall chemical decay coefficient (1/yr) (use conservative assumption for a non-degrading chemical)	0	Acid and base hydrolysis rates insignificant [Howard et al., 1991]
HYDROLYSIS RATE CONSTANTS AND REFERENCE TEMPERATURE Acid catalyzed hydrolysis rate (1/m-yr) (use conservative assumption for non-degrading chemical)	N/A	Overall chemical decay calculation determined/specified directly
Neutral hydrolysis rate constant (1/yr) (use conservative assumption for non-degrading chemical)	N/A	Overall chemical decay calculation specified directly in input
Base catalyzed hydrolysis rate (1/m-yr) (use conservative assumption for non-degrading chemical)	N/A	Overall chemical decay calculation specified directly in input
Reference temperature (°C)	N/A	Overall chemical decay calculation specified
Biodegradation coefficient (1/yr)	2.30	$t_{1/2}$ = 110 days for naturally occurring soil-ground-water systems and field observations [Dragun, 1988]

TABLE 3 (continued)

GROUND-WATER TRANSPORT MODEL INPUT PARAMETER	VALUE	JUSTIFICATION
CHEMICAL PROPERTIES OF CONTAMINANT		
Name - specify chemical to be modeled (use conservative assumption for a non-degrading chemical)	Trichloroethylene	--
DECAY COEFFICIENTS (SOLID, DISSOLVED, OVERALL)		
Solid phase decay coefficient (1/yr) (use conservative assumption for a non-degrading chemical)	N/A	Overall chemical decay calculation determined/specified directly
Dissolved phase decay coefficient (1/yr) (use conservative assumption for a non-degrading chemical)	N/A	Overall chemical decay calculation determined/specified directly
Overall chemical decay coefficient (1/yr) (use conservative assumption for a non-degrading chemical)	0	Is not hydrolyzed by water under normal conditions [Howard, 1990]
HYDROLYSIS RATE CONSTANTS AND REFERENCE TEMPERATURE		
Acid catalyzed hydrolysis rate (1/m-yr) (use conservative assumption for non-degrading chemical)	N/A	Overall chemical decay calculation determined/specified directly
Neutral hydrolysis rate constant (1/yr) (use conservative assumption for non-degrading chemical)	N/A	Overall chemical decay calculation determined/specified directly
Base catalyzed hydrolysis rate (1/m-yr) (use conservative assumption for non-degrading chemical)	N/A	Overall chemical decay calculation determined/specified directly
Reference temperature (°C)	N/A	Overall chemical decay calculation determined/specified directly
Biodegradation coefficient (1/yr)	0.843	$t_{1/2}$ = 300 days [Dragun, 1988]

TABLE 3 (continued)

GROUND-WATER TRANSPORT MODEL INPUT PARAMETER	VALUE	JUSTIFICATION
CHEMICAL PROPERTIES OF CONTAMINANT Name - specify chemical to be modeled (use conservative assumption for a non-degrading chemical)	Vinyl Chloride	--
DECAY COEFFICIENTS (SOLID, DISSOLVED, OVERALL) Solid phase decay coefficient (1/yr) (use conservative assumption for a non-degrading chemical)	N/A	Overall chemical decay calculation determined/specified directly
Dissolved phase decay coefficient (1/yr) (use conservative assumption for a non-degrading chemical)	N/A	Overall chemical decay calculation determined/specified directly
Overall chemical decay coefficient (1/yr) (use conservative assumption for a non-degrading chemical)	0	No hydroloyable groups [Howard, 1990]
HYDROLYSIS RATE CONSTANTS AND REFERENCE TEMPERATURE Acid catalyzed hydrolysis rate (1/m-yr) (use conservative assumption for non-degrading chemical)	N/A	Overall chemical decay calculation determined/specified directly
Neutral hydrolysis rate constant (1/yr) (use conservative assumption for non-degrading chemical)	N/A	Overall chemical decay calculation determined/specified directly
Base catalyzed hydrolysis rate (1/m-yr) (use conservative assumption for non-degrading chemical)	N/A	Overall chemical decay calculation determined/specified directly
Reference temperature (°C)	N/A	Overall chemical decay calculation determined/specified directly
Biodegradation coefficient (1/yr)	9.0	$t_{1/2}$ = 4 weeks based on laboratory experiments under anaerobic conditions [Howard, 1989]

HELP MODEL OUTPUT

Written by: CAL Date: 89 / 11 / 09 (YY MM DD) Reviewed By: BAG Date: 90 / 1 / 9 (YY MM DD)

Client: GBB Project: Millersville Landfill Project/Proposal No.: P 1160 Task No.: 72

CALCULATE LEACHATE GENERATION RATES TO DETERMINE CAPACITY OF ON-SITE LEACHATE STORAGE TANKS

GIVEN

1. Cell acreages : Cell 8 = 60 acres
   Cell 9 = ~~100~~ 85 acres
   Total acreage = ~~160~~ 145 acres BG
2. Maximum subcell acreage = 8.5 acres

SCENARIOS CONSIDERED

Consider 2 scenarios for leachate volume calculations :

Scenario 1 (Likely Scenario)

- 1 subcell open ;
- 1 subcell with intermediate cover ; and
- Remainder of Cells 8 and 9 with final cover system.

Scenario 2 (Very Conservative Scenario Resulting in Much Greater Leachate Generation Rates than Scenario 1)

- 1 subcell open ;
- Remainder of Cells 8 and 9 with ~~final~~ intermediate cover ~~system.~~ BG

Written by: CAL Date: __/__/__ (YY MM DD) Reviewed By: BAS Date: 90/1/9 (YY MM DD)

Client: _____ Project: _____ Project/Proposal No.: _____ Task No.: _____

CALCULATIONS

- Use the HELP model, Version 2 [USEPA, 1984a; 1984b; and other unpublished documents by Schroeder et al. for Version 2] to estimate leachate generation rates for the following cases:
  - .. Open subcell (modeled as a daily cover placed over the first 8 ft thick lift of waste in the subcell, see Figure 1); and
  - .. Subcell with intermediate cover (see Figure 2).
- For the case of a subcell with final cover system incorporating a geomembrane, use empirical equations developed by Bonaparte et al. [1989] to calculate leakage through holes in the final cover system geomembrane (see Figure 3 for final cover system cross-section).
- Data pertinent to the HELP model are presented in Tables 1 and 2 and Figures 1 and 2.
- Results are as follows (see attached HELP computer outputs and leakage calculations) for the maximum average leachate generation rates
  - .. Open subcell: 0.8107 in./month (for the month of January) or 710 gallons/acre/day
  - .. Subcell with intermediate cover: 0.1049 in./month (for the months of August and October) or 92 gpad
  - .. Subcell with final cover system: ~~10~~ 1 gpad BS

Written by: CAL Date: / / YY MM DD Reviewed By: BAS Date: 90 / 1 / 9 YY MM DD

Client: Project: Project/Proposal No.: Task No.:

CAPACITY OF LEACHATE STORAGE TANKS

Scenario 1 (~~Likely~~ Ideal Scenario)

- 1 subcell open : 710 gpad × 8.5 acres = 6,035 gpd ✓
- 1 subcell with Intermediate Cover : 92 gpad × 8.5 acres = 782 gpd ✓
- Remainder of Cells 8 and 9 with Final Cover System : ~~10~~ 1 gpad × (~~160~~ 145 − (2)(8.5)) acres = ~~1,430~~ 128 gpd BS

Total = ~~8,247~~ 6,945 gpd

⟹ 30-day leachate storage volume = ~~8,247~~ 6,945 gpd × 30 days = ~~247,410~~ 208,350 gallons

Scenario 2 (Very Conservative Scenario ; calculations done for comparison)

- 1 subcell open : 710 gpad × 8.5 acres = 6,035 gpd ✓
- Remainder of Cells 8 and 9 with ~~Final~~ Intermediate Cover ~~System~~ : 92 gpad × (~~160~~ 145 − 8.5) acres = ~~13,938~~ 12,558 gpd BS

Total = ~~19,973~~ 18,593 gpd

⟹ 30-day leachate storage volume = ~~19,973~~ 18,593 gpd × 30 days = ~~599,190~~ 557,790 gallons

Conclusion = The available on-site leachate storage volume of 500,000 gallons is more than adequate to provide for 30-day leachate storage.

Written by: BAG Date: 90/1/9 (YY/MM/DD) Reviewed By: JCW Date: [illegible] (YY/MM/DD)

Client: GBB Project: Millersville Landfill Project/Proposal No.: P1160 Task No.: 72

Scenario 3 (Likely Scenario)

- 1 subcell open: 710 gpad × 8.5 acres = [illegible]
- 4 subcells with intermediate cover: 92 gpad × 8.5 acres × 4 = 3128 gpd
- remaining cells w/ final cover: 1 gpad × 128 acres = 128 gpd

9,291 gpd

⟹ 30-day leachate storage volume =

9,291 gpd × 30 days = 278,730 gallons

- Annual leachate generation
- assume Scenario 3
  - 1 subcell open:

annual leachate generation = $\sum_{Jan}^{Dec}$ average monthly lateral drainage (from HELP)

= 6.986 in./year ✓

= 520 gpad

520 gpad × 8.5 acres = 4420 gpd

- 128 acres with final cover = 128 gpd
- 4 subcells with intermediate cover = 1.22 in./yr = 91 gpad 3094 gpd

7642 gpd

365-day leachate volume = 2,798,000 gallons ✓

average 30-day leachate volume 7642 × 30 = 230,000

DEFAULT SOIL CHARACTERISTICS

Soil Texture	Component	Porosity (Vol/Vol)	Field Capacity (Vol/Vol)	Wilting Point (Vol/Vol)	Hydraulic Conductivity (cm/s)
7	Protective Soil Cover; Daily Cover	0.473	0.222	0.104	5.2×10^{-4}
10 [1]	Intermediate Cover	0.398	0.244	0.136	1.2×10^{-4} after compaction 6×10^{-6}
16	Soil Liner	0.430	0.366	0.280	10^{-7}
18 [2]	Waste	0.520	0.294	0.140	2×10^{-4}
19 [3]	Geonet Drainage Layer	0.800	0.[illegible]5	0.0[illegible]	5

Notes: 1. The intermediate cover will be compacted. The effect of compaction is modeled by the HELP program by reducing the soil hydraulic conductivity by a factor of 20.

2. In addition to the values listed in the table for waste, waste initial moisture content values are entered in the program manually (See Figures 1 and 2 for these values).

3. The geonet drainage layer is modeled as a soil layer with physical and hydraulic characteristics similar to the actual "geosynthetic" geonet.

FINAL COVER SYSTEM

For leakage calculations, assume :

- 2 - ~~0.016~~ OK BS in.^{2} (~~10~~ OK BS mm^2) holes in the geomembrane per acre [Giroud and Bonaparte, 1989 and USEPA, 1987]
- Hydraulic conductivity of final cover soil is $\leq 10^{-4}$ cm/s
- Hydraulic head on the geomembrane = 0.2 in. (5 mm). (head equals thickness of geonet layer)
- ~~Poor~~ Good contact between the geomembrane and the final cover soil (~~in reality~~, contact between geomembrane and soil ~~may be~~ will likely be good since ~~if~~ proper quality assurance ~~is~~ will be provided during construction ; ~~poor contact assumption results in greater leakage rates than good contact and is therefore more conservative~~ ; the terms "poor contact" and "good contact" are ~~then~~ defined in [Giroud and Bonaparte, 1989]).

CALCULATIONS OF LEAKAGE

THROUGH FINAL COVER SYSTEM

Written by: CAL Date: / / (YY MM DD) Reviewed By: BAS Date: 90 / 1 / 9 (YY MM DD)

Client: Project: Project/Proposal No.: Task No.:

Flow through a hole in a geomembrane placed in contact with a low-permeability soil is, for good contact between soil and geomembrane [Bonaparte et al., 1989]:

$$Q = 0.21\, a^{0.1}\, h^{0.9}\, k^{0.74}$$

where: a = area of geomembrane hole; h = hydraulic head on the geomembrane; and k = hydraulic conductivity of final cover soil. (This equation can only be used with SI units.)

For ~~poor~~ good contact between soil and geomembrane; ~~the equation becomes according to GeoServices' unpublished documents~~:

$$Q = \cancel{1.15}\ 0.21\, a^{0.1}\, h^{0.9}\, k^{0.74}$$

$$= \cancel{1.15}\ 0.21 \left(10^{-8}\right)^{0.1} \left(5 \times 10^{-3}\right)^{0.9} \left(10^{-6}\right)^{0.74}$$

$$= \cancel{1.1 \times 10^{-7}}\ 2.0 \times 10^{-8}\ m^3/s$$ ✓ BS

Assuming 2 holes / acre, the calculated leakage rate is:

$$q = \left(\cancel{1.1 \times 10^{-7}}\ 2.0 \times 10^{-8}\ m^3/s\right)\left(1000\ \ell/m^3\right)\left(\frac{\text{gallons}}{3.78\ \ell}\right)\left(\frac{86400\ s}{\text{day}}\right)\left(2\ \text{holes/acre}\right)$$

$$= \cancel{5}\ 1\ \text{gpad}$$ ✓ BS

Therefore, assume leachate generation rate for subcell with final cover system = ~~10~~ 1 gpad

CONCENTRATION AFTER SATURATED ZONE MODEL 0.1396E-04

Point of compliance conc:

based on leachate = $0.1396 \times 10^{-4} \times$ BDL = $< 1.4 \times 10^{-4}$ µg/l

based on EPA data = $0.1396 \times 10^{-4} \times 202 = 2.8 \times 10^{-3}$ µg/l

HELP MODEL VERSION 4.0 BETA (2018)
DEVELOPED BY USEPA NATIONAL RISK MANAGEMENT RESEARCH LABORATORY

Title: Millersville Cell 9 - Open Cel... **Simulated On:** 6/9/2024 11:30

Layer 1

Type 1 - Vertical Percolation Layer (Cover Soil)
Municipal Solid Waste (MSW) (900 pcy)
Material Texture Number 18

Thickness	=	96	inches
Porosity	=	0.671	vol/vol
Field Capacity	=	0.292	vol/vol
Wilting Point	=	0.077	vol/vol
Initial Soil Water Content	=	0.2951	vol/vol
Effective Sat. Hyd. Conductivity	=	1.00E-03	cm/sec

Layer 2

Type 1 - Vertical Percolation Layer
Protective Cover/Drainage Layer
Material Texture Number 43

Thickness	=	24	inches
Porosity	=	0.437	vol/vol
Field Capacity	=	0.062	vol/vol
Wilting Point	=	0.024	vol/vol
Initial Soil Water Content	=	0.1296	vol/vol
Effective Sat. Hyd. Conductivity	=	5.00E-03	cm/sec

Layer 3

Type 2 - Lateral Drainage Layer
Geocomposite Drainage Layer
Material Texture Number 123

Thickness	=	0.25	inches
Porosity	=	0.85	vol/vol
Field Capacity	=	0.01	vol/vol
Wilting Point	=	0.005	vol/vol
Initial Soil Water Content	=	0.0331	vol/vol
Effective Sat. Hyd. Conductivity	=	8.40E+00	cm/sec
Slope	=	3	%
Drainage Length	=	750	ft

Layer 4

Type 4 - Flexible Membrane Liner

HDPE Membrane

Material Texture Number 35

Thickness	=	0.06	inches
Effective Sat. Hyd. Conductivity	=	2.00E-13	cm/sec
FML Pinhole Density	=	2	Holes/Acre
FML Installation Defects	=	2	Holes/Acre
FML Placement Quality	=	6	On geotextile

Layer 5

Type 2 - Lateral Drainage Layer

Geocomposite Drainage Layer

Material Texture Number 124

Thickness	=	0.25	inches
Porosity	=	0.85	vol/vol
Field Capacity	=	0.01	vol/vol
Wilting Point	=	0.005	vol/vol
Initial Soil Water Content	=	0.0199	vol/vol
Effective Sat. Hyd. Conductivity	=	8.40E+00	cm/sec
Slope	=	3	%
Drainage Length	=	750	ft

Layer 6

Type 4 - Flexible Membrane Liner

HDPE Membrane

Material Texture Number 35

Thickness	=	0.06	inches
Effective Sat. Hyd. Conductivity	=	2.00E-13	cm/sec
FML Pinhole Density	=	0	Holes/Acre
FML Installation Defects	=	0	Holes/Acre
FML Placement Quality	=	3	Good

Layer 7

Type 3 - Barrier Soil Liner

Prepared Subbase

Material Texture Number 44

Thickness	=	18	inches
Porosity	=	0.437	vol/vol
Field Capacity	=	0.373	vol/vol
Wilting Point	=	0.266	vol/vol

Initial Soil Water Content	=	0.437	vol/vol
Effective Sat. Hyd. Conductivity	=	1.00E-05	cm/sec

Note: Initial moisture content of the layers and snow water were computed as nearly steady-state values by HELP.

General Design and Evaporative Zone Data

SCS Runoff Curve Number	=	79	
Fraction of Area Allowing Runoff	=	0	%
Area projected on a horizontal plane	=	1	acres
Evaporative Zone Depth	=	12	inches
Initial Water in Evaporative Zone	=	3.414	inches
Upper Limit of Evaporative Storage	=	8.052	inches
Lower Limit of Evaporative Storage	=	0.924	inches
Initial Snow Water	=	0	inches
Initial Water in Layer Materials	=	39.321	inches
Total Initial Water	=	39.321	inches
Total Subsurface Inflow	=	0	inches/year

Note: SCS Runoff Curve Number was calculated by HELP.

Evapotranspiration and Weather Data

Station Latitude	=	39.12	Degrees
Maximum Leaf Area Index	=	5	
Start of Growing Season (Julian Date)	=	101	days
End of Growing Season (Julian Date)	=	302	days
Average Wind Speed	=	8	mph
Average 1st Quarter Relative Humidity	=	74	%
Average 2nd Quarter Relative Humidity	=	75	%
Average 3rd Quarter Relative Humidity	=	79	%
Average 4th Quarter Relative Humidity	=	71	%

Note: Evapotranspiration data was obtained for , Maryland

Normal Mean Monthly Precipitation (inches)

Jan/Jul	Feb/Aug	Mar/Sep	Apr/Oct	May/Nov	Jun/Dec
2.257529	2.418665	3.413312	3.239994	5.182143	3.635609
3.744875	3.882993	4.790159	3.583066	3.404002	2.486827

Note: Precipitation was simulated based on HELP V4 weather simulation for:
Lat/Long: 39.12/-76.68

Normal Mean Monthly Temperature (Degrees Fahrenheit)

Jan/Jul	Feb/Aug	Mar/Sep	Apr/Oct	May/Nov	Jun/Dec
36.6	41.2	44.3	58.7	65.7	76.1
83.2	78.6	75.4	57.2	47.3	35.2

Note: Temperature was simulated based on HELP V4 weather simulation for:
Lat/Long: 39.12/-76.68
Solar radiation was simulated based on HELP V4 weather simulation for:
Lat/Long: 39.12/-76.68

Daily Output for Year 1

Column key: Head #1: drainage from Layer 4 | Head #2: drainage from Layer 6
Drain #1: drainage from Layer 3 | Drain #2: drainage from Layer 5
Leak #1: leakage thru Layer 4 | Leak #2: leakage thru Layer 7

* = Frozen (air or soil)

Annual Totals for Year 1			
	inches	cubic feet	percent
Precipitation	40.65	147,554.3	100.00
Runoff	0.000	0.0000	0.00
Evapotranspiration	31.152	113,080.5	76.64
Drainage Collected from Layer 3	7.5591	27,439.6	18.60
Percolation/Leakage through Layer 4	1.947828	7,070.6	4.79
Average Head on Top of Layer 4	0.0109	---	---

Drainage Collected from Layer 5	1.9480	7,071.3	4.79
Percolation/Leakage through Layer 7	0.000002	0.0090	0.00
Average Head on Top of Layer 6	0.0028	---	---
Change in Water Storage	-0.0102	-37.1	-0.03
Soil Water at Start of Year	39.3235	142,744.3	96.74
Soil Water at End of Year	39.3133	142,707.2	96.72
Snow Water at Start of Year	0.0000	0.0000	0.00
Snow Water at End of Year	0.0000	0.0000	0.00
Annual Water Budget Balance	0.0000	0.0000	0.00

Daily Output for Year 2

Column key: Head #1: drainage from Layer 4 | Head #2: drainage from Layer 6
Drain #1: drainage from Layer 3 | Drain #2: drainage from Layer 5
Leak #1: leakage thru Layer 4 | Leak #2: leakage thru Layer 7

Title: Millersville Cell 9 - Open Cell Condition
Simulated On: 6/9/2024 11:31

Annual Totals for Year 3			
	inches	cubic feet	percent
Precipitation	46.78	169,801.3	100.00
Runoff	0.000	0.0000	0.00
Evapotranspiration	36.420	132,205.8	77.86
Drainage Collected from Layer 3	10.5284	38,218.2	22.51
Percolation/Leakage through Layer 4	2.519784	9,146.8	5.39
Average Head on Top of Layer 4	0.0152	---	---

Drainage Collected from Layer 5	2.5238	9,161.4	5.40
Percolation/Leakage through Layer 7	0.000002	0.0090	0.00
Average Head on Top of Layer 6	0.0036	---	---
Change in Water Storage	-2.6954	-9,784.2	-5.76
Soil Water at Start of Year	41.9675	152,341.9	89.72
Soil Water at End of Year	38.9623	141,433.1	83.29
Snow Water at Start of Year	0.0000	0.0000	0.00
Snow Water at End of Year	0.3098	1,124.7	0.66
Annual Water Budget Balance	0.0000	0.0000	0.00

Daily Output for Year 4

Column key: Head #1: drainage from Layer 4 | Head #2: drainage from Layer 6
Drain #1: drainage from Layer 3 | Drain #2: drainage from Layer 5
Leak #1: leakage thru Layer 4 | Leak #2: leakage thru Layer 7

Title: Millersville Cell 9 - Open Cell Condition
Simulated On: 6/9/2024 11:31

Percolation/Leakage through Layer 7	0.000002	0.0090	0.00
Average Head on Top of Layer 6	0.0031	---	---
Change in Water Storage	-0.2562	-929.9	-0.68
Soil Water at Start of Year	38.9623	141,433.1	102.85
Soil Water at End of Year	39.0160	141,627.9	102.99
Snow Water at Start of Year	0.3098	1,124.7	0.82
Snow Water at End of Year	0.0000	0.0000	0.00
Annual Water Budget Balance	0.0000	0.0000	0.00

Daily Output for Year 5

Column key: Head #1: drainage from Layer 4 | Head #2: drainage from Layer 6
Drain #1: drainage from Layer 3 | Drain #2: drainage from Layer 5
Leak #1: leakage thru Layer 4 | Leak #2: leakage thru Layer 7

Title: Millersville Cell 9 - Open Cell Condition
Simulated On: 6/9/2024 11:31

Day	Freezing Status* Air	Freezing Status* Soil	Rain (inches)	Runoff (inches)	ET (inches)	Evap. Zone Water (in/in)	Head #1 (inches)	Drain #1 (inches)	Leak #1 (inches)	Head #2 (inches)	Drain #2 (inches)	Leak #2 (inches)

Annual Totals for Year 6			
	inches	cubic feet	percent
Precipitation	43.15	156,625.8	100.00
Runoff	0.000	0.0000	0.00
Evapotranspiration	30.759	111,654.6	71.29
Drainage Collected from Layer 3	8.0773	29,320.7	18.72
Percolation/Leakage through Layer 4	2.087624	7,578.1	4.84
Average Head on Top of Layer 4	0.0116	---	---

Drainage Collected from Layer 5	2.0869	7,575.6	4.84
Percolation/Leakage through Layer 7	0.000002	0.0089	0.00
Average Head on Top of Layer 6	0.0030	---	---
Change in Water Storage	2.2245	8,074.9	5.16
Soil Water at Start of Year	41.1362	149,324.3	95.34
Soil Water at End of Year	43.1683	156,700.9	100.05
Snow Water at Start of Year	0.0504	183.0	0.12
Snow Water at End of Year	0.2428	881.4	0.56
Annual Water Budget Balance	0.0000	0.0000	0.00

Daily Output for Year 7

Column key: Head #1: drainage from Layer 4 | Head #2: drainage from Layer 6
Drain #1: drainage from Layer 3 | Drain #2: drainage from Layer 5
Leak #1: leakage thru Layer 4 | Leak #2: leakage thru Layer 7

Title: Millersville Cell 9 - Open Cell Condition
Simulated On: 6/9/2024 11:31

* = Frozen (air or soil)

Annual Totals for Year 8			
	inches	cubic feet	percent
Precipitation	34.13	123,878.6	100.00
Runoff	0.000	0.0000	0.00
Evapotranspiration	28.709	104,213.1	84.13
Drainage Collected from Layer 3	3.1084	11,283.7	9.11
Percolation/Leakage through Layer 4	1.256127	4,559.7	3.68
Average Head on Top of Layer 4	0.0045	---	---

Drainage Collected from Layer 5	1.2531	4,548.7	3.67
Percolation/Leakage through Layer 7	0.000002	0.0090	0.00
Average Head on Top of Layer 6	0.0018	---	---
Change in Water Storage	1.0560	3,833.2	3.09
Soil Water at Start of Year	39.0155	141,626.3	114.33
Soil Water at End of Year	40.1907	145,892.2	117.77
Snow Water at Start of Year	0.1192	432.7	0.35
Snow Water at End of Year	0.0000	0.0000	0.00
Annual Water Budget Balance	0.0000	0.0000	0.00

Daily Output for Year 9

Column key: Head #1: drainage from Layer 4 | Head #2: drainage from Layer 6
Drain #1: drainage from Layer 3 | Drain #2: drainage from Layer 5
Leak #1: leakage thru Layer 4 | Leak #2: leakage thru Layer 7

Title: Millersville Cell 9 - Open Cell Condition
Simulated On: 6/9/2024 11:31

Attachment 1
Phase II Permit Modification Application, 1989

PHASE II PERMIT MODIFICATION APPLICATION (FOR EXISTING REFUSE DISPOSAL PERMIT NUMBER 86-02-04-06A) MILLERSVILLE LANDFILL ANNE ARUNDEL COUNTY, MARYLAND

Submitted to

Secretary of the Environment
Department of the Environment
2500 Broening Highway
Baltimore, Maryland 21224

Submitted by

Anne Arundel County
Bureau of Solid Waste
Department of Public Works
389 Burns Crossing Road
Severn, Maryland 21144

26 October 1989

CERTIFICATION

This Phase II report and all attached drawings were developed under the direct supervision of Mr. Steven Shugart, P.G. and Dr. Mark Evans, P.E. Mr. Shugart's qualifications meet those of COMAR 26.04.07.07 B for a geologist. Dr. Evans' qualifications meet those of COMAR 26.04.07.07 B for a geotechnical engineer registered as a professional engineer in the State of Maryland.

Steven L. Shugart

CHECKLIST FOR PHASE II REPORT FOR MUNICIPAL WASTE LANDFILL

INFORMATION REQUIRED	PROVIDED	LOCATION
COMAR 26.04.07.07. A		
• Ten copies of the Phase II Report	X	---
COMAR 26.04.07.07. B		
• Signature of Geologist or Geotechnical Engineer	X	Certification
COMAR 26.04.07.07. C (1)		
• Topographic map with a practical contour interval showing the following:		
(a) surface waters and drainage	X	DWGS. II-1, II-2A, 2B
(b) 100-year flood plain	X	DWGS. II-1, Note 4
(c) property lines	X	DWGS. II-1, II-2A, B
(d) on-site buildings and structures	X	DWGS. II-2A, 2B
(e) forested and vegetated areas	X	DWGS. II-1, II-2A, 2B
(f) power lines, utilities, tanks	X	DWGS. II-2A, 2B
COMAR 26.04.07.07. C (2)		
• Discussion of geologic formations	X	Sections 2.3, 2.4
• Discussion of formation use	X	Sections 2.3, 2.4
• Discussion of hydrogeologic relationship	X	Sections 2.3, 2.4

INFORMATION REQUIRED	PROVIDED	LOCATION
COMAR 26.04.07.07. C (3)		
• Survey of production wells	X	Section 2.6
• Located on topographic map	Note (1)	
• Table with pertinent data	X	Appendix C
COMAR 26.04.07.07. C (4)		
• Ground-water contour maps showing occurence and direction of ground-water movement for:		
(a)(i) Most elevated ground-water condition	X	DWGS. II-10 to II-13
(a)(ii) Most depressed ground-water condition	X	DWGS. II-10 to II-13
(b) Highest observed or predicted ground-water	X	DWG. II-14
COMAR 26.04.07.07. C (5)		
• Geologic cross-section	X	DWGS. II-3 to II-9
COMAR 26.04.07.07. C (6)		
• Bedrock map	Not applicable in Coastal Plain	
COMAR 26.04.07.07. C (7)		
• Isopachous map	X	DWG. II-15

Note: (1) To be provided

INFORMATION REQUIRED	PROVIDED	LOCATION
COMAR 26.04.07.07. C (8)		
• Discussion of ground-water quality	X	Section 2.5
COMAR 26.04.07.07. C (9)		
• Discussion of potential of pollutant movement	X	Section 2.5
COMAR 26.04.07.07. C (10)		
• Fracture trace analysis	Not applicable in Coastal Plain	
COMAR 26.04.07.07. C (11)		
• Test boring logs	X	Appendix D
• Well completion reports	X	Appendix C
• Piezometric measurements	X	Section 2.4.2
• Physical soil/sediment analyses	X	Section 3.4
• Geotechnical analyses	X	Sections 4.5, 4.6
• Laboratory procedures	X	Section 3.4
• Field procedures	X	Section 3.3
COMAR 26.04.07.07. C (12)		
• Preliminary conceptual design including:		
(a) Liner system		
(i) strength and thickness	X	Sections 4.7, 4.10
(ii) materials, thickness, permeability, and subbase	X	Sections 4.4, 4.9
(iii) foundation stability	X	Sections 4.5, 4.6
(iv) liner coverage	X	Section 4.4
(v) minimum slope 2%	X	Section 4.4

INFORMATION REQUIRED	PROVIDED	LOCATION
(b) Buffer between liner and ground water of at least (3 ft (1m))	X	Section 4.4
(c) Leachate collection/removal system	X	Section 4.4
(i) chemical resistance/strength	X	Section 4.11
(ii) non-clogging	X	Section 4.12
(iii) maximum leachate depth of not more than (1 ft (0.3 m))	X	Section 4.8

1. INTRODUCTION

1.1 Overview

Anne Arundel County, Maryland (AAC) currently operates two sanitary landfills: Millersville Sanitary Landfill (MLF) and Sudley Road Sanitary Landfill (SLF). MLF serves the northern portion of the county and SLF serves the southern portion. Spurred by recent developments in landfill technology, special conditions in their existing operating permit, and the passage of specific environmental regulations governing solid waste disposal in Maryland (i.e., COMAR 26), AAC has undertaken the redesign of MLF and SLF.

MLF is currently operating under the State of Maryland Refuse Disposal Permit Number 86-02-04-06A. This Report is part of a Phase II Modification Application in support of a modification to Permit Number 86-02-04-06A to reflect the redesign of MLF. The Phase II Permit Modification Application for MLF is submitted in partial fulfillment of the municipal solid waste requirements of the Annotated Code of Maryland Title 26 - Department of the Environment, Subtitle 4 - Regulation of Water Supply, Sewage Disposal, and Solid Waste, Chapter 7 - Solid Waste Management (i.e., COMAR 26.04.07).

This Phase II Permit Modification Report addresses only the redesign aspects associated with new Cells 8 and 9 and leachate handling and removal facilities at MLF. Interim waste disposal activities that will be carried out at MLF are not addressed in this Phase II Permit Modification Report. Interim waste disposal activities are described in the "Compliance Activities Schedule for Millersville Landfill" submitted by Mr. R. Waesche, Chief, Bureau of Solid Waste, Anne Arundel County, Maryland to Mr. B. Schmidt, Chief, Solid Waste Enforcement Division,

Maryland Department of the Environment (MDE) on 2 October 1989. Interim waste disposal activities addressed in the compliance schedule include:

- continued landfilling in permitted active Cells 6 and 7;
- waste disposal in combined Cells 5, 6, and 7;
- relocation of waste from Cells 2, 3, and 4 to combined Cells 5, 6, and 7;
- closure and capping of combined Cells 5, 6, and 7;
- relocation of waste from Cell 1 West to Cell 1 East; and
- closure and capping of Cell 1 East.

Interim waste disposal activities will be addressed in documents that will be submitted to MDE under separate cover from this Phase II Permit Modification Report.

This Phase II Permit Modification Report was prepared for the Anne Arundel County Department of Public Works, Bureau of Solid Waste (BSW) by GeoServices Inc. Consulting Engineers (GeoServices), Norcross, Georgia and Gershman, Brickner and Bratton (GBB), Falls Church, Virginia.

1.2 Site Location and Description

The MLF site is located about 1 mile (2 km) due east of Fort George G. Meade and approximately 1 mile (2 km) northwest of Millersville in northern Anne Arundel County, Maryland (See Figure 1). The site is located in the Odenton Quadrangle of the United States Geological Survey (USGS) 7.5 minute map at a latitude of approximately N39°5′30" and a

longitude of approximately E76°40'00". The site occupies approximately 567 acres (230 hectares). An intermittent streams run across the site, generally from west to east, becoming perennial at the eastern site boundary. The stream continues to the east until meeting the Severn Run, which, in turn, eventually flows into the Severn River.

The site is divided into two sections by a 120 ft-wide Baltimore Gas and Electric right-of-way running generally west to east at approximately the northern third of the site. The northern half of the site has been developed and prior landfilling activities there are completed. The southern half is the location of present landfill activities. A large portion of the southern half of the site is undeveloped and densely wooded or covered with heavy brush. Elevations at the site range from a low of about 100 ft (30 m) above sea level datum at the center of the site along the intermittent stream banks, to a high of about 240 ft (72 m) above sea level datum at the southern and western site boundaries.

1.3 Site History

AAC began operations at MLF in January, 1975. The initial site development plan was prepared by Century Engineering in 1974 and included 10 distinct landfill cells numbered sequentially from Cell 1 to Cell 10. Cells 1 through 4 are located in the northern portion of the site (i.e., north of the Baltimore Gas and Electric right-of-way), Cells 5 through 8 are located in the center of the site, and Cells 9 and 10 are located in the southern portion of the site.

At the present time, Cells 1 through 7 have been filled to the design limits shown on Figure 2. Waste disposal at MLF has generally proceeded along guidelines and operating procedures described in the MLF operational plan, prepared by Century Engineering [1976].

The extent of current landfill development is shown in Drawings II-1, II-2A, and II-2B. The topographic map presented in Drawings II-2A and II-2B show the major features of the MLF site (as required by COMAR 26.04.07.07.C(1)), including: ground-surface elevations (as of March 1989), buildings and structures, streams and drainage features, forested areas, roads, power transmission lines, underground storage tanks, property lines, previously filled solid waste cells, and on-site sedimentation basins.

1.4 Project Description

The Phase II Permit Modification Application, of which this Phase II Report is a part, addresses redesign of previously-permitted Cells 8, 9, and 10 at the MLF site with the following changes incorporated into the redesign:

- Cells 9 and 10 from the existing refuse disposal permit will be incorporated into a single cell, referred to as Cell 9 in this Phase II Report;

- the new cells will have basically the same footprints as those in the existing permit but the final cover slope angles and the final heights will be modified; and

- each new cell will have a double-liner system with a leachate collection system incorporated above the top liner and a leakage detection system located above the bottom liner (this modification is in compliance with special condition number I.B.1.a of the existing refuse disposal permit and exceeds the requirements of COMAR 26.04.07.07.C(12)(a)); the new cells will also incorporate engineered final cover systems to minimize leachate generation after cell closure.

The proposed conceptual landfill redesign plan for MLF is discussed in detail in Section 4 of this Report.

1.5 Organization of the Report

COMAR 26.04.07.04 requires that anyone constructing or operating a sanitary landfill, or materially altering or extending a landfill, first obtain a permit. Permit requirements for municipal sanitary landfills are presented in COMAR 26.04.07.05 through 26.04.07.10. COMAR 26.04.07.07 requires preparation and submittal of a Phase II Report that includes:

(1) an up-to-date site specific topographic map showing surface waters and natural drainage features; 100-year flood plain; property lines; on-site buildings and structures; forested and vegetated areas; and power lines, utilities, and tanks on the property;

(2) a discussion of geologic formations beneath and in close proximity to the site, the present and projected use of these formations for ground-water and mineral use, and hydrogeologic relationships between the formations;

(3) a survey of all production wells within 0.5 mile (0.8 km) of the site boundary including well depth, screen type, productivity, materials encountered, and water level;

(4) ground-water contour maps showing the occurrence and movement of ground water for: (i) the most elevated ground-water condition; (ii) the most depressed ground-water condition; and (iii) the highest observed or predicted ground-water elevation;

(5) geologic cross-sections in sufficient detail, orientation, and number to clearly identify subsurface conditions at the site;

(6) a bedrock map (except in the Coastal Plain);

(7) an isopachous map showing soil thickness above the ground water;

(8) a discussion of ground-water quality;

(9) a discussion of the potential for vertical and horizontal movement of pollutants;

(10) a fracture trace (except in the Coastal Plain);

(11) test boring logs, well completion reports, piezometric measurements, chemical and physical soil/sediments analyses, and geotechnical analyses; and

(12) a preliminary conceptual landfill design including:

(a) a liner system that is: (i) constructed of synthetic or manufactured membrane material having sufficient strength and thickness and a minimum value of permeability less than a specified maximum; (ii) placed on a stable foundation; (iii) installed to cover all surrounding earth; and (iv) installed with a minimum slope of 2%;

(b) a minimum 3-ft (1-m) thick buffer distance between the liner system and the composite high water table; and

(c) a leachate collection and removal system that is (i) constructed of materials of sufficient strength, thickness, and chemical resistance; (ii) designed to function without clogging; and (iii) designed to ensure that the leachate depth does not exceed 1 ft (1 m) over the liner.

2. HYDROLOGY, GEOLOGY, AND HYDROGEOLOGY

2.1 Introduction

Anne Arundel County (AAC) is situated roughly in the center of the State of Maryland and is bordered on the north by the City of Baltimore and Baltimore County, on the west by Howard County and Prince Georges County, on the south by Calvert County, and on the east by the Chesapeake Bay. AAC lies entirely in the Coastal Plain physiographic province. This section of the Report discusses climate and physiography (Section 2.2), regional and site specific hydrology, geology and hydrogeology (Sections 2.3 and 2.4), ground-water quality (Section 2.5), and production water wells within 0.5 mile (0.8 km) of MLF (Section 2.6).

2.2 Climate and Physiography

Anne Arundel County is in the humid temperate climatic belt of the eastern part of the United States. It has warm summers and relatively mild winters. Mean annual precipitation is 44 in. (1.1 m) [Mack, 1962]. Monthly precipitation varies from year to year, but generally ranges between 2 and 4 in. (50 and 76 mm) [Mack, 1962]. Mean precipitation is evenly distributed during the year. Maximum and minimum monthly values may vary considerably. For example, the maximum recorded monthly rainfall in August is slightly greater than 14 in. (0.3 m), while the minimum recorded monthly rainfall in August is less than 0.2 in. (5 mm). Temperatures in AAC generally range between 35° Fahrenheit (F) (1.6° Centigrade (C)) and 77°F (25°C). The average annual temperature is 56°F (13°C) [Mack, 1962].

The MLF site lies in the Coastal Plain physiographic province about 10 miles (16 km) east of the fall zone. The fall zone separates the low lying gently rolling terrain of the Coastal Plain from the higher relief of the Piedmont physiographic province. The Coastal Plain in Maryland rises from sea level to elevations greater than 300 ft (90 m) above sea level datum. Relief may range from 20 to 100 ft (6 to 30 m). The regional slope falls to the east at about 1.5 ft per mile (0.3 m per km). The topography of the region is characterized by a series of broad step-like terraces. The terraces are progressively less dissected by stream erosion from west to east. Topography in AAC consists of low rolling hills in the western portion, which gradually become flatter from west to east. Several miles inland from the Chesapeake Bay, the land is flat with poor drainage.

Topography on the site consists of hills and valleys. A small stream valley that runs generally west to east dissects the site. Several smaller valleys running north-south merge with the main valley. The highest elevation at the site is about 240 ft (72 m) near Burns Crossing Road. The lowest elevation at the site is slightly less than 80 ft (24 m) on the eastern site boundary where the stream exits.

2.3 Regional Hydrology, Geology, and Hydrogeology

2.3.1 Regional Surface-Water Hydrology

Anne Arundel County is divided into two general drainage areas. The Patuxent River drains the western portion of the county and flows to Chesapeake Bay, nearly 30 miles (48 km) south of the southern tip of Calvert County. Several small river basins drain the eastern portion of the county directly into Chesapeake Bay. The Severn River, which is in the vicinity of the MLF site, is one of these basins.

Severn Run is the primary source of fresh water for the Severn River, which, in turn, is a tidal estuary of the Chesapeake Bay. The Severn Run watershed has an area of approximately 24 square miles (62 km^2) [CH2M Hill, 1980]. The watershed boundary is roughly defined by Route 3 to the east and Route 175 in the south. Route 175 to Fort George Meade define the western boundary. The northern boundary is defined by Severn Road and Clark Station Road. The main channel of Severn Run is approximately nine miles (14 km) long, originating at Lake Marion in the northwest section of the watershed. There are six major tributaries to Severn Run. Jabez Branch in the southeast portion of the basin has the largest tributary area. The Jabez Branch flows just south of MLF. Wells Branch, another tributary of Severn Run north of Jabez Branch, has its headwaters on the MLF site where it is an intermittent stream [CH2M Hill, 1980]. Perennial flow in the Wells Branch begins near the eastern boundary of the MLF site near Gambrills Road. The distance from the eastern property boundary to Severn Run is about 1 mile (1.6 km).

2.3.2 Regional Geology and Hydrogeology

The eastern half of AAC is marked by a series of peninsulas separated by Chesapeake Bay estuaries. The estuaries are extensive but shallow, generally less than 20 ft (6 m) deep. Several of the estuaries extend inland more than half the width of the county. A few of the peninsulas are flat and low lying with irregular shorelines. However, some peninsulas, such as along the Severn River, have steep escarpments. The highest elevation in the county is about 310 ft (93 m) and is east of the town of Laurel in the northwestern part of the county. From this high point, the land surface slopes gently toward the Chesapeake Bay.

Anne Arundel County is underlain by a southeastward thickening wedge of unconsolidated sediments overlying consolidated crystalline basement rocks of Precambrian or Early Cambrian age. The unconsolidated sediments

consist of stratified layers of sand, gravel, silt, and clay. The unconsolidated sediment wedge thins to a few tens of feet near the fall zone to the northwest and is probably 2,000 ft (600 m) thick in the southeastern part of the county. Sand and gravel strata comprise the major water-bearing aquifers of the county. Within the county, the slope or dip of the aquifers vary. The deepest aquifer, the Patuxent Formation, dips to the southeast at 85 to 90 ft per mile (15 to 16 m per km), whereas the shallowest aquifer dips to the southeast at only 15 to 20 ft per mile (3 to 4 m per km).

The Potomac Group comprises the entire thickness of unconsolidated sediments in the northern part of the county. It is overlapped by younger deposits ranging in age from Late Cretaceous to Holocene in the central part of the county (Figure 3). The stratigraphy of the Potomac Group is very complex. Formations of the group were deposited in fluvial and lacustrine environments. Sand, silt, and clay layers are commonly limited in areal extent. Sand lenses 25 ft (7.5 m) thick at a specific location have been found to be thicker, thinner, or absent at distances of 25 to 100 ft (7.5 to 30 m) from that location [Mack and Achmad, 1986].

The Potomac Group is comprised of three separate formations in AAC; these are, from the base upward, the Patuxent Formation, the Arundel Clay, and the Patapsco Formation. The Patapsco Formation can be regionally divided into an upper and lower unit each consisting of a clay overlying a predominantly sand sequence. The Patapsco Formation includes all of the lithologies from the base of the overlying upper Cretaceous Magothy Formation to the top of the underlying Arundel Clay. The total thickness of the Patapsco Formation in Anne Arundel County is approximately 500 ft (150 m) [Mack and Achmad, 1986] and dips towards the southeast.

The Potomac Group contains three distinct aquifers in AAC; namely, the Patuxent, lower Patapsco and upper Patapsco. All three aquifers are

confined, except in the outcrop areas where water-table or unconfined conditions exist. Confining layers separate the aquifers in most places. Water level records from clusters of wells that tap the different aquifers indicate that the sands are hydrologically separated from one another. The water level records show that pumping of water from one of the aquifers at a specific site commonly has no immediate effect on water levels in the other aquifers [Mack and Achmad, 1986].

The Magothy Formation overlies the Potomac Group. According to Mack [1962], this aquifer is hydrologically connected in varying degrees with the underlying Patapsco aquifer. The Magothy Formation dips to the southeast at about 30 ft/mile (6 m/km) and is utilized for water supply in the Annapolis area.

2.4 Site Hydrology, Geology, and Hydrogeology

2.4.1 Site Surface-Water Hydrology

No perennial streams are located on the MLF site. As previously discussed, Wells Branch is an intermittent stream on site. Its headwaters originate on the western portion of the site near Burns Crossing Road. Flow in Wells Branch is most likely fed from shallow, perched ground water. During dry periods, perched ground water may be depleted through percolation into deeper water-bearing zones and inflow into Wells Branch. At these times, the upper reach of Wells Branch ceases to flow. Wells Branch receives stormwater flow from several intermittent tributary stream channels north and south of the main channel. Stormwater flow also comes from discharges from the sedimentation basins at MLF. There are presently six sedimentation basins at MLF; three adjacent to Cells 1, 2, and 3; and three closest to Wells Branch near Cells 5, 6, and 7 (see Drawings II-2A and II-2B).

2.4.2 Site Geology and Hydrogeology

A site subsurface investigation was conducted in the early 1970's when AAC purchased the Edgewood Farm Country Club for the purpose of constructing MLF. Twenty-five test holes were drilled as part of a routine subsurface investigation and observation wells were installed and screened in various subsurface water bearing zones.

Surface geologic mapping in the vicinity of the MLF site (see Figure 4) indicates the predominance of the silt-clay facies of the Potomac Group in the northeastern part of the site and the sand-gravel facies of the Potomac Group in the central portion of the site. The Magothy Formation, a predominantly sandy unit, outcrops along the southern boundary of the site just north of Dicus Mill Road. Ferruginous cementation is common in the fluvial facies of the Magothy Formation. Blocks of ironstone conglomerate outcrop in this area.

Ground-water studies by Mack [1962] and Mack and Achmad [1986] suggest that the silt-clay facies of the Potomac Group at MLF is part of a clay confining layer separating the overlying Magothy Formation from the underlying upper Patapsco Formation (Figure 3). The discontinuous silt-clay facies (upper confining layer) at MLF occurs at the ground surface under Cells 1, 6, 7, and part of Cell 5, and at or near the ground surface under Cell 4. The sand-gravel facies of the Potomac Group occurs at the center of MLF, from the vicinity of TW8 to TW4, roughly paralleling the existing surface drainage; this facies probably represents an old stream channel. The southern half of the site is capped by the sands of the Magothy Formation. Sand lenses occur within the silt-clay facies (i.e., within the upper confining layer) underlying the entire site.

Drawing II-3 presents a plan view showing the locations of the geologic sections presented in Drawings II-4 to II-9. These geologic sections are oriented roughly along the strike and dip directions of the formations at MLF. The geologic sections were developed from site subsurface investigation boring logs developed in 1975 and 1989, and from ground-water monitoring well completion reports.

From all of the available information reviewed for the preparation of this Report, it appears that four water-bearing zones occur in the upper 300 ft (90 m) beneath MLF (i.e., to a depth of approximately 135 ft (40.5 m) below sea level datum). The uppermost zone (Zone 1) is in the fluvial sands of the Magothy Formation. Ground water in this zone is unconfined and perched. This water-bearing zone is restricted to the southern and southwestern boundaries of the site, north of Dicus Mill Road, and along Burns Crossing Road, respectively. During all or part of the year, this zone may be dry in some areas.

The second water-bearing zone (Zone 2) occurs in a shallow sand zone within the silt-clay facies described by Glaser [1976]. (Note: The silt-clay facies described by Glaser is the same as the confining layer described by Mack and Achmad [1986] that separates the overlying Magothy Formation from the underlying upper Patapsco. The shallow sand zone in the silt-clay facies has also been described by Pittman [1982].) In the southern part of the site, this sand zone may be either unconfined or confined, and is recharged directly from precipitation or leakage from the overlying perched aquifer. The potentiometric surface of the shallow sand zone in this area shows a strong reflection of the local topography (see Drawings II-10 and II-11). North of the drainage valley that cuts through the central area of the site, water levels in the shallow sand zone are similar to those in a deeper sand zone (both sand zones have been described by Pittman [1982]), suggesting some hydrologic interconnection.

The third water-bearing zone (Zone 3) is the deep sand zone described by Pittman [1982]. This sand zone is located approximately 25 ft (7.5 m) below the shallow zone in the southern half of the site, and below the outcropping silt-clay facies in the northern half of the site. The potentiometric surface for this zone (see Drawings II-12 and II-13) indicates regional flow in an easterly to northeasterly direction. Ground water in this zone is either semi-confined or confined. The hydrostatic heads in this water-bearing zone are lower than the perched or shallow zones indicating the potential for recharge by leakage from the overlying zones.

The fourth water-bearing zone (Zone 4) is the upper Patapsco aquifer, which is the major ground-water aquifer in the vicinity of MLF. The top of the aquifer occurs at an elevation of about 10 ft (3 m) above sea level datum in the northeast corner of the site near Well TW16, and about sea level at Well TW9 (see Drawing II-4). The production well near the maintenance building (i.e., near the southwestern site boundary) is probably screened in the upper Patapsco aquifer. The upper Patapsco aquifer is confined at MLF by clays of the upper confining layer [Mack and Achmad, 1986] (i.e., the silt-clay facies described by Glaser, [1976]) separating the Magothy Formation from the upper Patapsco sands. The hydrostatic head in the upper Patapsco aquifer is lower than the head in the overlying water-bearing zones as is typical near the outcrop of a major recharge area. TW9 is the only ground-water monitoring well tapping the upper Patapsco aquifer at the site for which long-term water level data is available. Since 1984, there has been a 5 ft (1.5 m) decline in the average water level in Well TW9 (see water level data in Appendix A).

Long-term hydrographs from wells tapping Zone 2 and Zone 3 also show a 5 ft (1.5 m) decline in water levels beginning in 1982. This decline is attributed to long term leakage to the upper Patapsco Aquifer in

response to increased ground-water withdrawal from the Patapsco Aquifer. The hydrographs for wells tapping the various water-bearing zones at MLF are included in Appendix A. In the future, continued ground-water pumping will probably result in further declines in water-levels beneath the site.

As required in COMAR 26.04.07.07.C(4), the maximum ground-water elevations have been predicted for MLF. These ground-water elevations are shown on Drawing II-14. To arrive at these maximum predicted ground-water levels, a 5 ft (1.5 m) head was added to Zone 2 ground-water elevations for September 1989; the September 1989 elevations were obtained after an unusually wet summer. As previously mentioned, a decreasing trend in water levels is evident in hydrographs from on-site wells. The decreasing water levels are most likely due to regional pumpage around the site associated with ground-water usage. Since ground-water levels appear to be decreasing with time, the methodology used to obtain the maximum predicted ground-water elevations is believed to be conservative. The ground-water elevations in Drawing II-14 will be used to design landfill Cells 8 and 9 so that they meet the 3 ft (1 m) minimum ground-water separation requirements of COMAR 26.04.07.07.C(12)(b).

2.5 Ground-Water Quality

In order to monitor ground-water quality at MLF, wells were installed in 1975 and ground-water samples have been collected and analyzed since landfilling began. During the early 1980s, Well TW11 began to show low, fluctuating concentrations of organic constituents. Therefore, in 1989, AAC began investigating the nature and extent of ground-water contamination. This section of the Report discusses recent results from the site-wide water-quality monitoring program instituted in 1975 and from the recent ground-water contamination study conducted in the vicinity of TW11.

2.5.1 Site-Wide Monitoring Program

Ground-water samples from wells at MLF have been collected generally 2 or 3 times per year since 1975. Samples were collected and analyzed by MDE for the parameters listed in Table 1 of this Report. In order to characterize water quality at MLF, GeoServices evaluated generally accepted key indicator parameters from the results of MDE's analytical program. Key indicator parameters used by GeoServices are pH, nitrate, chloride, specific conductance, alkalinity, hardness, arsenic, barium, cadmium, chromium, lead, mercury, selenium, chemical oxygen demand (COD), and volatile organics. An evaluation of these parameters meets the requirements of COMAR 26.04.07.07.C(8). Analytical results tabulated from 1975 through 1988 for these parameters are presented in Appendix B. Average values for each parameter are presented in Table 2 and maximum values are presented in Table 3 (except for volatile organics, which are discussed separately, and presented in Tables 4 and 5). Each parameter is discussed below.

pH

Average pH values at MLF range from 5.7 in TW16 to 9.9 in TW1. However, these two values appear to be outside the typical range seen at MLF. All of the other average pH readings are between 5.9 and 7. The USEPA's established acceptable water quality range for pH is from 6.5 to 9. Most of the average pH values for the wells at MLF are slightly below the accepted range. Therefore, ground water at MLF may be slightly acidic due to the local geology. To evaluate pH in each MLF well, a single-sample Student's T-test was performed on the existing data. The test was performed using TW10 as the background well and the most recent pH value in each well. Average pH values and statistical results which appear to be significant are discussed in Section 2.5.3.

Nitrate

No significant nitrate concentrations are evident in any of the wells at MLF.

Chloride

Average chloride concentrations at MLF range from 1.1 milligrams per liter (mg/l) to 36.1 mg/l, with all concentrations below 7 mg/l except TW3A and TW16 with 17.1 mg/l and 36.1 mg/l, respectively. USEPA does not have water quality criteria for chloride. Average chloride concentrations and statistical evaluations of significant differences are discussed in Section 2.5.3.

Specific Conductance

Average specific conductance (SC) values range from 21 micromhos per centimeter (umhos/cm) to 345 umhos/cm. Most average values are below 100 umhos/cm with only TW1, TW7, TW13A, and TW16 having average values above 100 umhos/cm. TW1 has an average value of 279 umhos/cm. However, most of the early readings were elevated (i.e., 1980-1982 readings). Since 1983 all of the SC readings in TW1 have been below 100 except two readings (June 1987 - 156 umhos/cm; March 1988 - 120 umhos/cm). In TW7, most of the high SC readings also occurred before 1983. Since 1983, all of the readings have been below 100 umhos/cm. In TW13A, the average SC value is 116 umhos/cm, but only four readings were obtained during 1979 and 1980. Two of the readings are above 150 umhos/cm, one is just below 100 umhos/cm and one is very low at 12 umhos/cm. TW16 consistently had the highest SC concentrations; readings from this well ranged from 45 to 581 umhos/cm. Most readings were above 300 umhos/cm.

Alkalinity

No significant alkalinity concentrations are evident in any of the wells at MLF.

Hardness

No significant hardness concentrations are evident in any of the wells at MLF.

Arsenic

No significant arsenic concentrations are evident in any of the wells at MLF.

Barium

No significant barium concentrations are evident in any of the wells at MLF.

Cadmium

Average cadmium concentrations ranged from below detection levels (BDL) to 0.142 milligrams per liter (mg/l) with the highest average reading obtained in TW2A. It appears that a single cadmium reading of 1.42 mg/l in November 1983 caused the high average reading in TW2A. Since that one isolated high reading, no cadmium sample has been higher than 0.002 mg/l. It is likely that the high reading of November 1983 represents an error in sampling or analysis, and not cadmium contamination. Also, landfilling has not taken place in the vicinity of

TW2A. Therefore, it appears that there is no significant cadmium contamination at MLF.

Chromium

Average chromium concentrations at MLF range from BDL to 0.30 mg/l. However, most concentrations are below 0.02 mg/l. Only two wells exhibited significant average chromium concentrations; these wells are TW13A and TW16. In TW13A, only two samples were analyzed for chromium: in August 1975 and in September 1980. The August 1975 sample had a chromium concentration of 0.5 mg/l and the September 1980 sample had a chromium concentration of 0.03 mg/l. It is impossible to evaluate the significance of the data with only two samples. In TW16, eight samples were analyzed for chromium. The range of concentrations of the eight samples was 0.03 mg/l to 0.28 mg/l. All except one of the concentrations appear to be significant (i.e., above Federal and State drinking water standards). Chromium concentrations of significance are discussed in Section 2.5.3.

Lead

Average lead concentrations range from BDL to 0.30 mg/l. The highest average concentration was found in TW13A and significant concentrations (i.e., above Federal and State drinking water standards) are also evident in TW7, TW10, TW11, and TW16. Eleven samples from TW7 were analyzed for lead. Four samples had detectable concentrations which ranged from 0.01 to 0.35 mg/l while concentrations in the remaining seven samples were below detection limits. The most recent sample, obtained in August 1988, had a lead concentration of 0.08 mg/l. Four samples from TW10 were tested for lead. Concentrations ranged from BDL to 0.20 mg/l. TW10 is considered an upgradient well, and therefore, ground water flowing beneath the MLF site contains lead either from natural or non-landfill sources.

Concentrations of lead in TW11 ranged from BDL to .99 mg/l. Nine samples were collected between 1975 and 1988 from TW11 and only three samples had lead concentrations below the Federal and State primary drinking water standard. TW13A had significant levels of lead in each of the three samples collected during 1975 to 1980. Nine ground-water samples from TW16 were analyzed for lead. The range of concentrations for this well was BDL to 0.51 mg/l. The concentrations of four of the samples are higher than the Federal and State drinking water standard for lead. Lead concentrations of significance are discussed in Section 2.5.3.

Mercury

The average concentration of mercury in TW13A was high. However, only two ground-water samples were collected at this well. One measurement showed no mercury and the other 0.80 mg/l. Evaluation of the small data set is not meaningful. No mercury concentrations of significance were detected in any of the other wells at MLF.

Chemical Oxygen Demand (COD)

Average COD concentrations range from BDL to 18 mg/l. The highest average concentration was in TW16. Significant COD results are discussed in Section 2.5.3.

Volatile Organics

Volatile organic compounds have been detected in a few wells at MLF, but in significant levels only in TW11. Constituents present at detectable levels in TW11 include: chloromethane, dichlorofluoromethane, vinyl chloride, chloroethane, methylene chloride, trichlorotrifluoromethane, trichlorofluoromethane, 1,1-dichloroethane, 1,1-dichloroethene, chloroform, 1,1,2-trichloroethane, 1,1,1-

trichloroethane, tetrachloroethene, trichloroethene, ethylbenzene, xylene, tetrahydrofuran, ethyl ether, dichlorodifluoromethane, and chlorodifluoromethane. Maximum measured concentrations in TW11 are shown in Table 4. In order to investigate contamination in TW11, Anne Arundel County authorized GeoServices to install, develop, and sample new ground-water monitoring wells. The results of the ground-water contamination investigation are discussed in the following section.

In addition to TW11, as previously mentioned, low concentrations of organic compounds were also detected in other wells. Table 4 presents the maximum observed values of organic compounds in wells at MLF. The data show low levels of volatile organic and other organic compounds in 15 wells (excluding TW11). None of the measured concentrations in these 15 wells exceed regulatory criteria (i.e., maximum contaminant levels (MCLs), maximum contaminant level goals (MCLGs), carcinogen risk specific doses (RSDs), or systemic toxicant reference doses (RFDs)). Continued ground-water quality monitoring of these wells is planned as part of the overall site monitoring program.

2.5.2 Ground-Water Contamination Study

GeoServices performed a ground-water contamination study during 1989. The study involved installing eleven new wells (i.e., G1, G2, G4-G11, and G13) in the vicinity of TW11 to determine the extent of the ground-water contamination observed in TW11. The wells were developed and sampled (except G2) in June 1989 and analytical testing was performed to evaluate chemical constituent concentrations. A summary of the results of the analytical testing is contained in Table 5.

The results revealed that ground water at the sampled locations contains volatile organic constituents, but no significant concentrations of base/neutral extractable compounds, pesticides, polychlorinated

biphenyls (PCBs) or metals. Table 5 shows that at the time of sampling, Wells G4, G5, G7, G9, G10, G11, and TW11 had low concentrations of several volatile organic compounds. TW11 had the highest number of constituents, including trichlorofluoromethane, methylene chloride, 1,1-dichloroethane, 1,1,1-trichloroethane, and tetrachloroethene. Results indicate the following:

- Contamination in the vicinity of Cell Number 4 does not appear to have moved significantly beyond TW11, because the analytical results obtained from Well G13 did not reveal contamination.

- Analytical results from Wells G10 and G11 reveal that leachate from Cell Numbers 3 and 2, respectively, may be contaminating ground water.

In order to further define the extent of contamination in the vicinity of Cells 1 through 4, AAC is continuing its contamination study. GeoServices is currently installing nine new wells to monitor ground-water Zones 2 and 3 at MLF. The new wells will supplement overall site monitoring provided by existing wells and further characterize the nature and extent of ground-water contamination.

2.5.3 Ground-Water Assessment

To evaluate ground-water quality at MLF, GeoServices analyzed all of the data available from AAC and MDE records. Normally used indicator parameters were selected from the entire data base and tabulated data summaries were prepared. These data summaries are presented in Appendix B. Four methods of analysis were employed in the evaluation: (i) mean values of all of the data were prepared (Table 2) and values of the key indicator parameters in each well were compared against all of the other wells; (ii) mean values in each well were compared against Federal and

State water quality criteria and standards; (iii) a statistical test (a simple Students T-test) was performed using TW10 as the background well and the most recent sampling episode from each well; and (iv) analytical data from each well that showed significant differences in water quality was further evaluated to observe historical trends. Based on the preceding evaluations, the following wells show some significant differences in ground-water quality from the upgradient well TW10 during the time in which they have been monitored: TW3A, TW6A, TW11, TW14A, and TW16. Each of these wells is discussed below.

TW3A

The statistical evaluation in Table 6 comparing data from TW10 and the most recent sampling event in TW3A show differences at a 0.05 level of significance for both specific conductance and chlorides. However, no conclusive trends are evident in the record of analytical data. Subsequent analytical results from TW3A should be observed and evaluated to identify any trends that might indicate ground-water contamination at this location.

TW6A

The statistical evaluation shown in Table 6 comparing data from TW10 and the most recent sampling event in TW6A show differences at a 0.05 level of significance for both specific conductance and chlorides. No samples have been collected since November 1986. However, the last four specific conductance readings showed slight increases. No other key constituents appear to be present at levels of concern in TW6A. During future sampling events, a sample will be obtained from TW6A for testing. (Note: TW6A has been dry on some occasions and may not yield sufficient water for a sample.)

TW11

The statistical evaluation shown in Table 6 for the most recent data show differences at a 0.05 level of significance for specific conductance and chlorides. Specific conductance values have increased since 1985. Chromium and lead have also been detected at high levels (i.e., relative to Federal drinking water standards). Chlorinated organic compounds have been detected since 1985. Well TW11 ground-water samples exhibit contamination, most likely from Cell 4. However, data from other wells suggest that the contamination has not moved significantly beyond the location of Well TW11. Additional ground-water contamination studies are currently underway at MLF around TW11.

TW14A

The statistical evaluation shows differences at a 0.05 level of significance for the last pH reading in TW14A. The pH measurements show decreasing values since October 1985. No other constituents have significant concentrations in TW14A. Values of pH and other constituents should be observed periodically in this well.

TW16

The statistical evaluation shown in Table 6 for TW16 shows differences at a 0.05 level of significance for pH, specific conductance and chlorides. In addition, in TW16, the average pH values are lower than any other well and the specific conductance and chlorides values are higher than any other well. Significant levels of chromium and lead have also been detected. TW16 also had the highest COD concentration compared to all of the other wells at MLF. Considering all of the data from TW16, some ground-water contamination may be present at this location. A new

well, TW17, is currently being drilled near TW16 to further investigate potential contamination at this location.

Summary

Ground-water contamination is present at MLF near Cell Number 4 as evidenced from well data for TW11. Contamination may also be present near TW16. Further investigations are currently underway to install additional ground-water monitoring wells at key locations throughout the site. AAC plans to conduct a water-quality assessment and risk assessment of data from all of the wells (once they are available) and to then evaluate any potential future impacts on the environment and public health.

2.5.4 Potential for Contaminant Migration

The preceding sections of this Report have described the geology and hydrogeology in the region around and at MLF as well as ground-water quality beneath MLF. The hydrogeology data show four water-bearing zones at the site. Zone 1 is a perched zone and is limited to the southern and southwestern parts of the site; (i.e., the Magothy aquifer); Zones 2 and 3 are intermediate zones, and Zone 4 is the regional aquifer at the site (i.e., the upper Patapsco aquifer). Geologic cross-sections for MLF show partial hydraulic interconnection between Zones 2 and 3, which is reflected by similar water levels in wells that are screened in these two zones. Zone 4 appears to be hydraulically separated from Zone 2 and 3, which is reflected by different water levels in wells screened in these zones. However, water level measurements show the hydraulic head in Zones 2 and 3 is greater than the hydraulic head in Zone 4. Therefore, the potential for leakage through the confining layer between Zones 2 and 3, and Zone 4 is possible; leakage through the confining zone would, however, be at a slow rate.

While vertical leakage through confining layers at MLF is possible, the potential for migration of chemical constituents through layers is limited by the low permeabilities of the layers and the significant potential for the layers to attenuate the concentrations of many constituents. Generally, metals will be attenuated by cation exchange or physical adsorption on clays, with metal ions of highest charge tending to be attenuated most. Organic constituents will be attenuated by adsorption of these compounds to naturally occurring organic carbon in the confining layer. Organic compounds with high polarities, similar to the polarity of soil organics, will be attenuated most.

Potential for subsurface contaminant movement is greatest in the central portion of the site where a sand body is present along the route of the stream valleys. Less potential is likely in the northwest and south portions of the site where thick silt-clay layers are present.

The potential for vertical and horizontal movements of pollutant into the waters of Maryland are included in response to COMAR 26.04.07.07C(9) as they relate to the construction of Cells 8 and 9. The potential of any leachate migration into the ground or surface waters of Maryland from Cells 8 or 9 is extremely small because of the engineering features of the proposed redesign for each cell. The proposed redesign for each cell will incorporate a double-liner system with a leachate collection system above the top liner and a leakage detection system between the top and bottom liners. These systems, if installed properly, will effectively prevent any adverse impacts of construction of Cells 8 and 9 on ground-water quality. In the extremely unlikely event, however, that leachate escaped into the environment, ground-water Zone 2 would be the initial receptor. The direction of ground-water flow for Zone 2 is shown in Drawings II-10 and II-11. A potential vertical pathway exists where ground-water Zones 2 and 3 are in close proximity in the vicinity of the intermittent

tributaries of Severn Run in the center of the MLF. The direction of ground-water flow of Zone 3 is shown in Drawings II-12 and II-13. The principal direction of ground-water flow from Zones 2 and 3 at the site boundary is northeast and east. The quantities of leachate that might leak through the double-liner system of Cells 8 and 9 are extremely small. It is not anticipated that any measurable concentrations of contaminant will show up in the ground water because of (i) the extremely small volume of leachate that could escape from the landfill, (ii) the adsorption of metals and organics by subsurface clays and organic matter, and (iii) natural dilution.

All the deep borings at MLF indicate a clay confining layer separating Zone 3 from Zone 4. (See Drawings II-4 through Drawings II-9.) There is a potential downward vertical gradient across this confining layer. However, no measurable concentrations of contaminant are expected to migrate through the confining layer due to the cation exchanges and attenuation properties of the clays.

Additional monitoring wells have been installed in the central portion of the site along the stream valley where the greatest potential for subsurface contaminant movement exists. These wells are near the downgradient boundary of Cells 8 and 9. Therefore, the current monitoring well network should be sufficient to detect any contaminant migration from Cells 8 and 9.

Assessment studies are currently under way to evaluate existing low levels of ground-water contamination related to previously constructed and filled landfill cells. The evaluation and risk assessment will be presented to MDE in a separate report.

2.6 Production Water Wells

A survey of production wells within 0.5 mile (0.8 km) of the MLF site boundary was conducted according to the provisions of COMAR 26.04.07.07 C(3). The area of interest was defined using the Maryland State Coordinate System (Figure 8). A computer retrieval was generated for the defined area around the MLF from the Maryland Department of the Environment, Division of Residential Sanitation for well applications processed from 1969 to 1989. The computer retrieval (D130 WMA1) is included as Appendix C. The well completion reports for the wells listed in the computer retrieval were requested from the Maryland Water Resources Administration in Annapolis, Maryland. These reports are also included in Appendix C. The reports show the location of the wells, well depths, screen type, productivity, materials encountered, and water level. Wells drilled prior to 1969 were not inventoried, since it is believed that most, if not all, of the wells older than 20 years have deteriorated and been replaced by newer wells. This belief is supported by the well completion reports (i.e., a number of the well completion reports also contained well abandonment reports).

Figure 8 shows the MLF site boundary, Maryland State coordinate system grid blocks (1000 ft by 1000ft (300 m by 300 m)) within 0.5 mile (0.8 km) of the site, grid blocks in which wells were detected by the well inventory, ground-water potentiometric contours, and ground-water flow direction.

3. GEOTECHNICAL INVESTIGATION

3.1 Introduction

This section presents the results of the geotechnical investigation performed for the Millersville Landfill (MLF) site as part of the Phase II Permit Modification Application for Refuse Disposal Permit Number 86-02-04-06A. This section complies with COMAR 26.04.07.07.C(11).

3.2 Purpose and Scope

An investigation and evaluation of subsurface soils was conducted during 1989 to provide information necessary for landfill redesign. Information was required for evaluation of borrow soil, foundation stability, and ground-water levels. The 1989 geotechnical investigation was conducted to supplement already available information from previous investigations at the site. The scope of the 1989 investigation included:

- reviewing existing surface and subsurface data;
- drilling 12 new soil borings and collecting disturbed (i.e., jar) samples;
- conducting standard penetration tests (SPTs);
- classifying soils on site;
- installing ground-water monitoring wells;
- conducting laboratory tests on representative soil samples;

- evaluating the resulting data; and
- preparing this section of the report.

3.3 Subsurface Investigation

3.3.1 Existing Soil Borings

Forty-five soil borings were performed prior to 1989 at the MLF site for previous design activities and filings of previous permit applications. The information from these borings was used during the geotechnical and hydrogeological evaluations performed for this Phase II Report.

3.3.2 New Soil Borings

Twelve new soil borings were performed during 1989 as part of the preparation of this permit modification application. Boring locations are shown in Drawing II-16; boring logs are included in Appendix D. The twelve new soil borings were required to better define subsurface conditions, to confirm the results of the previous subsurface investigations, and to install new ground-water monitoring wells. The soil borings were advanced by the hollow-stem auger (HSA) method according to ASTM D1452 *Standard Practice for Soil Investigation and Sampling by Auger Borings*. One borehole, G3, was advanced by the rotary-wash method and was advanced deeper than the other borings (to a depth of 180 ft (55 m)).

Field investigation, sampling, classification, and shipping were performed in general accordance with the following ASTM standards:

- ASTM D420 Standard Guide for Investigating and Sampling Soil and Rock;
- ASTM D1452 Standard Practice for Soil Investigating and Sampling Soil by Auger Borings;
- ASTM D1586 Standard Method for Penetration Test and Split-Barrel Sampling of Soils;
- ASTM D2488 Standard Practice for Description and Identification of Soils (Visual-Manual Procedure); and
- ASTM D4220 Standard Practice for Preserving and Transporting Soil Samples.

All soil borings were logged in the field by a GeoServices' geotechnical engineer. Disturbed soil samples were collected in each boring at nominal 5 ft (1.5 m) intervals. A split-spoon sampler was used to obtain disturbed samples in conjunction with the standard penetration test (SPT). SPTs were conducted in accordance with procedures outlined in ASTM Standard D1586. The SPT uses a 140 lb (620 N) hammer falling a distance of 30 in. (76 cm) to drive a standard 2-in. (5-cm) outside diameter split-spoon sampler a distance of 18 in. (46 cm). Blows per 6 in. (15 cm) increment are recorded for each sample. The standard penetration resistance, N, is the sum of the blows from the second and third 6 in. (15 cm) increments. N values are used to characterize the engineering properties of in-situ materials.

Soil samples were obtained from the split-spoon sampler and stored in jars marked with the project number, boring number, sample number, and sample depth. The samples were shipped to GeoServices' Geomechanics and Environmental Laboratory in Norcross, Georgia for testing and storage.

The soil samples were classified in the field according to ASTM D2488. The approach and format for the field classifications conform, in most respects, to ASTM D2487. Engineering properties of the soil samples were estimated based on N-values and soil classifications. Soil sample intervals and classifications are shown in the soil boring logs presented in Appendix D.

A horizontal and vertical survey was performed to accurately locate the soil borings by Greenhorne and O'Mara, Inc. in August 1989.

3.4 Laboratory Testing

Laboratory testing was performed by GeoServices on selected disturbed soil samples obtained from the 1989 soil borings. The purpose of the testing program was to classify subsurface soils to aid in estimating their engineering properties. Laboratory test results were also used to verify the results of the visual field classification.

The laboratory testing program consisted of the following tests:

- ASTM D422 Particle Size Analysis of Soils
- ASTM D2216 Laboratory Determination of Water Content of Soil, Rock, and Soil-Aggregate Mixtures
- ASTM D2487 Standard Test Method for Classification of Soils for Engineering Purposes; and
- ASTM D4318 Liquid Limit, Plastic Limit, and Plasticity Index of Soils (Atterberg Limits).

A summary of results of the laboratory tests performed is presented in Table 7. Soil grain size distribution curves are presented in Appendix E.

3.5 Geotechnical Characterization

For the purposes of geotechnical analyses and evaluation, three cross sections were cut through the site in the vicinity of proposed Cells 8 and 9. A plan view showing where the cross sections were cut is shown in Drawing II-16 and the cross sections are shown in Drawings 11-17, II-18, and II-19. USCS soil classification and N values are shown in the cross-sections. The USCS soil classification symbols noted in these drawings include parentheses (i.e., (SM)) when based on visual field identification and are without parentheses (i.e., SM) when based on laboratory test results.

The subsurface soils generally consist of interlayered poorly-graded sands and low-plasticity silts and clays with each layer in the range of tens of feet to hundreds of feet thick. An idealized soil profile is shown in Figure 9. This soil profile was derived from two sources: soil boring G3 drilled to a depth of 180 ft (55 m); and the Nevamar soil boring as reported in Mack and Achmad [1986] (see Figure 7).

The following section of this report (Section 4) presents the geotechnical engineering and lining system evaluations required by COMAR 26.04.07.07.(11) and (12). The evaluations are based, in part, on the information collected during the geotechnical investigation described in this section of the Phase II Report, as well as all information previously collected at the site.

4. CONCEPTUAL LANDFILL REDESIGN

4.1 Introduction

This section presents the conceptual landfill redesign for Cells 8 and 9 at MLF. The elements of the redesign covered in this Phase II Report include:

- design of new Cells 8 and 9 incorporating a double-liner system with a leachate collection layer above the top geomembrane liner and a leakage detection layer between the top and bottom geomembrane liners;

- design of a final cover system for Cells 8 and 9; the cover system incorporates a geomembrane cap overlain by a drainage layer; and

- design of a leachate collection system.

This redesign plan does not cover activities related to relocation, regrading, and closure of existing Cells 1 to 7, as discussed in Section 1 of this report (i.e., it does not cover the interim waste disposal activities described in the 2 October 1989 "Compliance Activities Schedule for Millersville Landfill" submitted by AAC to MDE).

New lined landfill Cells 8 and 9 will be constructed within the general footprints of old Cells 8, 9, and 10, currently defined by the existing permit drawings. New Cell 8 (old Cell 8) will occupy approximately 60 acres (24 hectares) and its projected life is approximately five years. The cell will be divided into eight lined subcells with base elevations ranging from about 110 to 140 ft (34 to

43 m) above sea level datum. The final cover elevation will to be no higher than elevation 300 ft (91 m) sea level datum.

New Cell 9 (old Cells 9 and 10) will occupy approximately 100 (40 hectares) acres and its projected life is approximately eight to ten years. The base and final cover elevations for Cell 9 will be approximately the same as those for Cell 8.

This section of the Phase II Report is organized as follows:

- proposed cell layout and filling sequence (Section 4.2);
- access roads and site drainage (Section 4.3);
- preliminary landfill liner system and cover system (Section 4.4);
- preliminary foundation settlement (Section 4.5);
- landfill stability analyses (Section 4.6);
- liner properties (Section 4.7);
- leachate head on the top liner (Section 4.8);
- liner system permeability (Section 4.9);
- liner system resistance to chemical attack (Section 4.10);
- properties of leachate collection and leakage detection system materials (Section 4.11); and
- resistance of drainage layers to clogging (Section 4.12).

4.2 Proposed Cell Layout and Filling Sequence

The proposed cell and subcell layouts for Cells 8 and 9 are shown in Drawing II-22. Cell 8 will be divided into eight subcells, each with an approximate area of 7.5 acres (3.0 hectares). Cell 9 will be divided into about 12 subcells, each with an approximate area of 8 acres (3.2 hectares). Leachate collection sumps and pumps will be located in each subcell as shown in Drawing II-22.

Cell 8 will be the first of the newly constructed cells and will be developed from east to west. The first two subcells will have an available landfill airspace that will allow approximately 6 months of landfilling at projected waste hauling rates (1,200 tons per day). The next two subcells will add approximately 18 months capacity, for a combined capacity in the first four subcells of approximately two years. The entire cell is estimated to have an active life of approximately five years and a total volume of approximately 5 million yd^3 (4 million m^3), including volume for daily cover.

Cell 9 will be developed after Cell 8 is completed, and will also be developed from east to west. Cell 9 has an estimated active life of eight to ten years, and a total volume, including daily cover, of approximately 8 to 10 million yd^3 (6 to 8 million m^3).

4.3 Access Roads and Site Drainage

A perimeter access road will be constructed around Cell 8 to connect it with the existing main access road. The new road will provide access for construction traffic, waste hauling trucks, operations and maintenance equipment, as well as access to the leachate sumps that will be located around the perimeter of the cell. After Cell 8 is filled, an access road will be constructed along the northern edge of Cell 9 to connect it with the existing main access road. It will not be necessary to construct an access road entirely around Cell 9 since leachate sumps will be located only along the northern edge. Subcell access (in Cell 9) for landfilling will occur from the access road to the north.

Perimeter berms and surface-water drainage ditches will be constructed around the entire perimeter of both new cells. The berms and ditches will be constructed in a phased manner, in conjunction with the phased

development of the landfill subcells. The berms and drainage ditches will prevent both run-on to active construction areas (or operating subcells) and run-off from active construction areas (or operating subcells). The perimeter drainage ditches will also serve to collect run-off from landfill cover slopes.

A conceptual sedimentation basin layout is shown in Drawing II-23. Perimeter drainage ditches will drain into the sedimentation basins. Run-off will be impounded in the sedimentation basins so that suspended sediment can settle out before the impounded water discharges on-site into Wells Branch. At this preliminary design stage, four sedimentation basins are planned for development of Cells 8 and 9.

Federal Emergency Management Agency (FEMA) Flood Insurance Rate Maps for Anne Arundel County, Maryland, dated May, 1983, were reviewed to locate 100-year flood plains at MLF. It was found that no 100-year flood plains are present at the site. The nearest 100-year flood plain is about one-half mile north and one-mile east of the site boundary along the Severn Run.

4.4 Preliminary Landfill Liner System and Cover System

Preliminary landfill liner system and cover system details are shown in Drawing II-24. The proposed liner system significantly exceeds the requirements of COMAR 24.04.07.07.C(12)(a)(i), (ii), and (12)(c), and provides an extremely high level of leachate containment. The double-liner system will be installed to cover all earth that could potentially be in contact with waste or leachate (as required by COMAR 26.04.07.07.C(12)(a)(iv)) and will have a minimum slope of 2% or more (as required by COMAR 26.04.07.07.C(12)(a)(v)).

The double-liner system proposed for MLF will consist of the following components (from top to bottom):

- 2-ft (0.6-m) thick protective soil cover layer;
- 10 oz/yd^2 (140 g/m^2) nonwoven geotextile filter layer;
- leachate collection system consisting of a layer of high density polyethylene (HDPE) geonet, a system of perforated collector pipes and sumps;
- 60-mil (1.5 mm) thick HDPE geomembrane top liner;
- leakage detection system consisting of a layer of HDPE geonet, a system of geonet collector swales, and sumps; and
- 60-mil (1.5 mm) thick HDPE geomembrane bottom liner.

The liner system will be placed over an 18-in. (0.45-m) thick recompacted subbase having a hydraulic conductivity no greater than 1 x 10^{-5} cm/s. This subbase thickness is less than the 24 in. (0.6 m) required by COMAR 26.04.07.07.C(12)(a)(ii), however, as allowed by this regulation, a demonstration will be provided in the Phase III Permit Modification Application showing that the proposed double-liner system provides a level of protection to public health and the environment in excess of the requirements of COMAR 26.04.07.07. and, therefore, that the proposed design is acceptable.

The liner system will be located a minimum of 3 ft (1 m) above the composite high water table in accordance with COMAR 26.04.07.07. C(12)(b)(i). The highest predicted ground-water table is shown in Drawing II-24.

The proposed cover system for MLF is composed of the following components (from top to bottom):

- 2-ft (0.6-m) thick cover soil layer (includes top soil);
- 10 oz/yd^2 (140 g/m^2) nonwoven geotextile filter layer;
- HDPE geonet drainage layer;
- nonwoven geotextile layer; and
- 40-mil (1.0 mm) thick textured HDPE geomembrane cap.

The cover system will be placed over a of 2-ft (0.6-m) thick final soil cover (measured from the final compacted waste lift).

4.5 Foundation Settlement

4.5.1 Introduction

Foundation settlement analyses were performed to evaluate whether the foundation soils were capable of providing adequate support to the lining system, as required by COMAR 26.04.07.07.C(12)(a)(iii).

4.5.2 Settlement Analyses

An idealized soil profile for the site is presented in Figure 9. It may be seen that the subsurface soils are generally composed of relatively thick layers (tens to hundreds of feet) of poorly-graded sands and low-plasticity silts and clays. Two components of settlement were considered:

- elastic compression of the sand; and
- consolidation of the silt and clay.

Elastic compression was estimated for the top 30 ft (10 m) of sand below the cell floor. Settlement analyses and procedures are presented in Appendix F. Boring G8 indicated average N values of about 25 to a depth of about 30 ft (10 m) below the cell floor; all other borings indicated N values below the cell floor in the range of from 50 to more than 100. N values of 25 indicate medium dense soil and N values over 50 indicate very dense soil. It was considered that elastic compression of the sand layers deeper than 30 ft below the cell floor would be negligible since N values ranged from about 50 to greater than 100 in that depth range.

Consolidation settlements in the two clay layers below the site were calculated using standard geotechnical analysis techniques. Settlement analyses and procedures are presented in Appendix F. Soil properties used in the analyses were estimated from field descriptions, field testing including N values, and laboratory index tests.

4.5.3 Results

Total elastic compression and consolidation settlements were calculated to be less than 1 ft (0.3 m) in the center of Cell 8 (See Appendix F). A similar value of settlement is anticipated for Cell 9 (less settlement may actually occur for Cell 9 since the proposed excavation is deeper). This magnitude of settlement will introduce negligible changes in the slope of the base of a cell for a cell width of about 1,200 ft (400 m). Thus, cell drainage will not be adversely affected by settlements. Furthermore, the settlements will induce negligible liner strains and have virtually no effect on landfill

components such as pipes, sumps, side slope risers, etc. Therefore, the requirement of COMAR 26.04.07.07.C(12)(a)(iii) is easily met.

4.6 Stability Analyses

4.6.1 Introduction

This section presents the results of stability analyses performed for Cells 8 and 9 at MLF. Stability analyses were conducted for several individual cases: the landfill excavation prior to placement of the liner system and waste; the liner system placed on the excavated side slopes; the municipal solid waste (MSW) slopes; the cover system; and the entire landfill after final closure. Stability analyses of the landfill foundation after final closure were not deemed necessary at this preliminary design stage, given the medium dense to very dense nature of the foundation soils. The foundation of the landfill should be stable.

The organization of this section is as follows:

- Section 4.6.2 presents a discussion of the cell geometry, liner system cross section, and cover system cross section that were considered for the stability analyses;

- Section 4.6.3 presents a discussion of the material properties of the in situ soils, liner system components, and cover system components that were selected for the stability analyses;

- Section 4.6.4 presents a discussion of the methods used to evaluate stability; and

- Section 4.6.5 presents the results and conclusions of the stability analyses.

4.6.2 Description of Cells 8 and 9

4.6.2.1 Geometry

A plan view of proposed Cells 8 and 9 is shown in Drawing II-16. The base of the cells will have excavated side slopes with a maximum inclination of four horizontal to one vertical (4H:1V) and base slopes inclined between 2% and 4%. For preliminary stability analyses, the maximum height of the side slopes is estimated to be 65 ft (20 m).

The cover system side slopes will be inclined at approximately 3.7H:1V and will have a 15-ft (4.6-m) wide bench incorporated into the slope at every 25 ft (7.6 m) of vertical rise (i.e.: the average inclination of the side slopes and the benches will be 4H:1V). The cover system top slopes will have a minimum inclination of 6%.

For the stability analyses presented herein, it was assumed that the waste will be placed in lifts across an entire subcell and that the working face of the waste will be sloped at 3H:1V. The maximum height of the MSW is assumed to be 140 ft (43 m).

4.6.2.2 Liner System Cross Section

The preliminary liner system design is illustrated in Drawing II-24. The components of the lining system were described in Section 4.5.

4.6.2.3 Cover System Cross Section

The preliminary cover system design is illustrated in Drawing II-24. The components of the cover system were described in Section 4.5.

4.6.3 Material Properties

4.6.3.1 Insitu Soils

The results of the soil borings (see Appendix D) indicate that the soils underlying the base of the landfill are predominantly poorly graded sands and low plasticity silts and clays. For preliminary stability analyses, these soils were estimated to have a moist unit weight of 120 lb/ft^3 (19 kN/m^3) and an effective-stress friction angle of 26° (based on data in Lambe and Whitman [1969]). This friction angle is believed to be conservative (i.e., the actual friction angle should be larger than this value).

4.6.3.2 Municipal Solid Waste

The MSW was assumed to have an effective-stress friction angle of 25° and an effective-stress cohesion of zero. These shear strength parameters are believed to be conservative for compacted MSW,as discussed below.

A correlation between Standard Penetration Test (SPT) results and effective-stress friction angle has been established for granular soils [Peck et al., 1974]. Using this correlation and limited data from SPTs on MSW (from Sowers [1968], Frydman and Baker [1986], and GeoServices' project files), values of effective-stress friction angle ranging from 25° to 30° are obtained.

The values noted above are consistent with stable MSW slopes observed at existing landfills (i.e., waste slopes at 2H:1V or steeper). The drained strength of MSW from a landfill in Italy has been estimated by Pagotto and Rimoldi [1987] based on the results of plate load tests. From their results, they estimated an effective-stress friction angle of 22° and an effective-stress cohesion of 630 lb/ft^2 (30 kN/m^2).

Based on the foregoing values drawn from SPT and plate load test results, the assumed MSW shear strength parameters appear to be conservative. The unit weight of the combined MSW and daily cover was assumed to be 60 lb/ft^3 (9 kN/m^3). This unit weight is at the upper end of the range of values commonly assumed for stability analyses (i.e., 50 to 60 lb/ft^3 (8 to 9 kN/m^3)) and, therefore, should be conservative.

4.6.3.3 Liner System Components

The stability of the landfill liner system will be governed by the shear strength characteristics of the individual component interfaces. To evaluate stability, the weakest interface between the liner system components needs to be identified. The values of interface friction angle, δ, and interface adhesion, a, used for the stability analyses are as follows:

- protective soil cover/nonwoven geotextile, $\delta = 26°$, a = 0 [Martin et al., 1984];

- nonwoven geotextile/HDPE geonet, $\delta = 20°$, a = 0 [Williams and Luna, 1987];

- HDPE geonet/HDPE geomembrane, $\delta = 11°$, a = 20 psf (1kN/m^2) [Williams and Houlihan, 1986]; and

- HDPE geomembrane/compacted subbase, $\delta = 16°$, a = 0 [Martin et al., 1984; Koerner et al., 1986].

The properties of the protective soil cover must also be estimated to evaluate the stability of the liner system. For preliminary stability analyses, the protective soil cover is assumed to have an effective-stress

friction angle of 30°, effective-stress cohesion of zero, and moist unit weight of 120 lb/ft^3 (19 kN/m^3).

4.6.3.4 Cover System Components

The interface friction angles and interface adhesions of the cover system components used for the stability analyses are as follows:

- protective soil cover/nonwoven geotextile, δ = 26°, a = 0 [Martin et al., 1984];
- nonwoven geotextile/HDPE geonet, δ = 20°, a = 0 [Williams and Luna, 1987];
- HDPE geonet/nonwoven geotextile, δ = 20°, a = 0 [Williams and Luna, 1987];
- nonwoven geotextile/textured HDPE geomembrane, δ = 20°, a = 0 (GeoServices project files); and
- textured HDPE geomembrane/intermediate soil cover, δ = 20°, a = 0 [Koerner et al., 1986].

The properties of the soil cover must also be estimated to evaluate the stability of the cover system. For preliminary stability analyses, the soil cover is assumed to have an effective-stress friction angle of 30°, effective-stress cohesion of zero, and moist unit weight of 120 lb/ft^3 (19 kN/m^3).

4.6.4 Method of Analysis

The stability of the liner system before MSW placement and the stability of the cover system was evaluated using a classical two-part wedge analysis equation derived by GeoServices. For this analysis, the factor of safety is defined as the ratio of resisting forces and driving forces. The equation giving the factor of safety (FS) is given below:

$$FS = \frac{\dfrac{aH}{\sin\beta} + \dfrac{cT\cos\phi}{\sin\beta\,\cos(\phi+\beta)} + \dfrac{\gamma T^2\sin\phi}{\sin 2\beta\,\cos(\phi+\beta)} + \dfrac{\gamma T^2\tan\delta}{2\sin\beta} + \left(\dfrac{2H\cos\beta}{T} - 1\right)}{\gamma T\left(H - \dfrac{T}{2\cos\beta}\right)}$$

(Equation 1)

where: γ = cover soil unit weight (lb/ft^3 or kN/m^3);
c = cover soil cohesion (lb/ft^2 or kN/m^2);
ϕ = cover soil friction angle (degrees);
T = thickness of cover soil layer (ft or m);
a = interface adhesion (lb/ft^2 or kN/m^2);
δ = interface friction angle (degrees);
H = height of slope (ft or m); and
β = slope angle (degrees).

The stability of the excavated soil slopes, liner system after MSW placement, MSW working face slopes, and liner system after landfill closure was evaluated using the slope stability computer program PCSTABL5 developed at Purdue University [Carpenter, 1986]. The stability of the landfill was evaluated for circular failure surfaces using the modified

Bishop method of slices or non-circular, wedge-shape, failure surfaces using the simplified Janbu method of slices, as appropriate.

4.6.5 Results and Conclusions

The results of the landfill stability analyses are presented in Appendix G. The results of the foundation excavation stability analysis show that the excavated side slopes have a factor of safety of 2.0, which indicates that the landfill excavation should be stable.

The liner system has a minimum slope stability factor of safety of 1.3 for the time period after the protective soil cover is placed on the landfill side slopes but prior to placement of MSW against the slope. This factor of safety is adequate based on our experience. This factor of safety will increase to 1.4 or more as the MSW is placed against the liner system side slopes and across the subcell. Therefore, the preliminary analyses indicate that the liner system should be stable.

The 3H:1V slope of the landfill working face has a minimum factor of safety of 1.9 and, therefore, should be stable.

The cover system has a minimum factor of safety of 1.5 on the 3.7H:1V final landfill slopes, and, therefore, should be stable.

The landfill has a minimum factor of safety of 1.3 after placement of final cover. This factor of safety indicates that the landfill should be stable for long-term conditions.

4.7 Liner Properties

4.7.1 Introduction

This section of the Phase II Report is presented to demonstrate that the requirements of COMAR 26.04.07.07.C(12)(a)(i) and (ii) are satisfied. This section first addresses geomembrane thickness and then addresses: geomembrane resistance to tensile and concentrated stresses; effects of temperature; chemical resistance; and installation considerations.

4.7.2 Geomembrane Thickness

A 60 mil (1.5 mm) thick HDPE geomembrane is proposed for the top and bottom liners. The thickness of each of these geomembrane liners exceeds the requirement of COMAR 26.04.07.07.C(12)(a)(ii).

4.7.3 Resistance to Tensile Stresses

Geomembranes used in landfills are subjected to tensile stresses resulting from a variety of causes including: gravity stresses; settlement; thermal contraction; etc. Geomembranes must, therefore, be engineered to have adequate tensile behavior. Several aspects of tensile behavior should be considered, including tensile strength and elongation. These aspects are discussed below:

- *Tensile Strength.* Sixty-mil (1.5-mm) thick HDPE geomembranes typically exhibit tensile strengths of approximately 120 lb/in. (21 kN/m) at a uniaxial yield strain of 10%.

- *Elongation.* HDPE geomembranes exhibit yield at approximately 10% strain. Although, in many cases, HDPE geomembranes may elongate significantly beyond the yield point, there are other cases where they have failed shortly after the yield point [Giroud, 1984]. Therefore, the elongation at yield should be used as a maximum elongation when designing with HDPE geomembranes, and the design strength should be the strength at yield.

For MLF, the HDPE geomembranes will be designed for a maximum strain much less than their yield strain (i.e., a maximum design strain of less than 1%). Therefore, the resistance of the proposed HDPE geomembranes to tensile yield will be more than adequate.

4.7.4 Resistance to Concentrated Stresses

Geomembranes used in landfills are subjected to concentrated stresses when they are in contact with, or close proximity to, stones, aggregate, concrete irregularities, steel battens used for connections to appurtenances, etc. Geomembranes resistance to concentrated stresses can be evaluated using laboratory tests such as the grab, tear, puncture, and burst tests. Results of these tests depend on many parameters including: geomembrane tensile strength, geomembrane modulus, test speed, etc. Tests conducted in laboratories indicate that HDPE geomembranes have relatively high grab strength and tear resistance.

The geomembrane top liner will be in contact with a geonet layer on its top side and bottom side. The geomembrane bottom liner will be in contact with a geonet layer on its top side and compacted subgrade soil on its bottom side. It is anticipated that the compacted subgrade soil will be composed of on-site silty sand, clayey sand, or clayey silt which should be free of gravel particles. Therfore, neither the geonet nor the

subgrade soil will exert significant concentrated stresses on either the top or bottom geomembrane liner.

During construction, care will be exercised during soil placement adjacent to the geomembranes (i.e., the subgrade soil will be free of rocks and rolled smooth; the first lift of the protective soil cover will be at least 12 in. (0.3 m) thick and will be spread with a light ground-pressure dozer; construction equipment will not be allowed to drive on the geosynthetics), and a thorough construction quality assurance program will be implemented. The landfill operating plan will also require that special precautions be taken in placing the first lift of waste above the liner system. Therefore, damage to the geomembrane due to concentrated stresses is unlikely.

4.7.5 Effect of Temperature

HDPE geomembranes exhibit significant strength loss at high temperatures. For example, at 167°F (75°C), the yield strength of an HDPE geomembrane is 40% of the yield strength at 68°F (20°C) (from test results given in a Schlegel Lining Technology brochure), and the modulus is only 20% of the modulus at 68°F (20°C) [Turner, 1968].

The mechanical properties of HDPE geomembranes are very sensitive to high temperatures because the melting temperature of HDPE is rather low: 257 to 275°F (125 to 135°C). However, HDPE softening at high temperatures cannot be considered a drawback, because it is due to this characteristic that HDPE geomembranes are easily welded.

Temperatures on the order of 140°F (60°C) have been recorded in the middle of municipal waste landfills due to waste decomposition. At MLF, the presence of a 24-in. (0.6-m) thick protective soil cover layer will insulate the geomembrane liners from potentially high waste temperatures.

Therefore, temperature should not have any significant effect on the geomembranes.

4.7.6 Chemical Resistance

Since the late 1970s, extensive laboratory testing has been conducted to evaluate the chemical compatibility of several types of geomembranes with a variety of chemicals typically encountered in waste. Most of this work was sponsored by the U.S. Environmental Protection Agency (USEPA). A summary of these studies can be found in reports by Haxo et al. [1982] and Schwope et al. [1985].

The extensive testing that has taken place has shown that, among all materials tested, HDPE geomembranes have the highest degree of compatibility with almost all chemicals encountered in waste. As a result, in the past few years, there has been a tendency to automatically select HDPE geomembranes (or the closely related linear medium density polyethylene (LMDPE) geomembranes) for all liner systems used for hazardous waste containment. The use of HDPE geomembranes in the MLF liner system appears to be in agreement with the state of the art.

Specific information regarding the resistance of HDPE geomembranes to attack by municipal solid waste leachate is presented in Section 4.10.

4.7.7 Seaming

In our extensive construction quality assurance (CQA) experience, relatively thick HDPE geomembrane liners (i.e., 40 mils (1.0 mm) or greater) are required to ensure good seam quality. A 60 mil (1.5 mm) HDPE geomembrane liner can form high quality seams when constructed properly in the field. To ensure that the highest quality field seams are produced, continuous monitoring of all seaming operations will be conducted by trained, experienced construction quality assurance monitors.

In addition, 100% of all field seam will be field tested (using a vacuum box test or pressure test) as part of the liner installer's construction quality control activities.

4.7.8 Conclusions

Based on the considerations presented in this section, it is concluded that the top and bottom geomembrane liners will have the appropriate physical, chemical, mechanical, and thermal properties so as to perform as designed and be resistant to failure.

4.8 Leachate Head on the Top Liner

The leachate head above the top liner should be less than 1 ft (0.3 m), as required by COMAR 26.04.07.07.C(12)(c)(iii). This section presents calculations of the maximum leachate head above the top liner.

4.8.1 Leachate Head Calculations

The leachate head in the leachate collection system is a function of a number of parameters including: leachate impingement rate; hydraulic conductivity of the leachate collection system; and geometry of the leachate collection system. The design leachate impingement rate is taken conservatively as the rate corresponding to 25% infiltration from a 7-day storm with a 100-year recurrence interval. The 100-year, 7-day storm for Anne Arundel County, Maryland is 12 in. (30 cm) [U.S. Department of Commerce, 1964]. This highly conservative assumption of 25% infiltration will be refined in the Phase III report. However, this conservative, preliminary assumption is considered appropriate for the purpose of this Phase II report. Therefore, the design leachate impingement rate for calculation purposes is conservatively assumed to be $q_i = 1.3 \times 10^{-5}$ cm/s (1.3×10^{-7} m/s).

The minimum hydraulic conductivity of the geonet leachate collection system is estimated to be 5 cm/s (5×10^{-2} m/s), based on a review of the literature.

The most critical section of the leachate collection system is the one with a combination of flow path length and drainage slope resulting in the greatest leachate head. For preliminary design, the plan length of the flow path and the slope are considered to be 300 ft (91 m) and 4%, respectively. For this critical section, leachate heads can be calculated using Moore's equation [USEPA, 1983]:

$$h_{max} = L\ [q_i/k + \tan^2\beta)^{0.5} - \tan\beta] \qquad \text{(Equation 2)}$$

where: h_{max} = maximum leachate head above the primary liner (ft or m); L = plan length of the flow path in the leachate collection system (ft or m); q_i = design leachate impingement rate (cm/s or m/s); k = hydraulic conductivity of the geonet drainage layer (cm/s or m/s); and tan β = slope of the leachate collection system (dimensionless).

For L = 300 ft (91 m), $q_i = 1.3 \times 10^{-5}$ cm/s (1.3×10^{-7} m/s), k = 5 cm/s (0.05 m/s), and tan β = 0.04. Equation 2 gives: h_{max} = 0.01 ft (0.3 cm).

4.8.2 Conclusion

The calculated maximum leachate head is 0.01 ft (0.3 cm). Therefore, the leachate collection system will ensure that the leachate head on or above the top liner does not exceed 1 ft (0.3 m).

4.9 Liner System Permeability

4.9.1 Introduction

COMAR Section 26.04.07.07.C(12)(a)(ii) specifies that the liner system shall be constructed of "one or more unreinforced synthetic membranes with a combined thickness of 50 mil, ..., which has a permeability of less than or equal to 1×10^{-10} cm/sec". The proposed top and bottom liners are 60-mil (1.5-mm) thick high density polyethylene (HDPE) geomembranes. All polymers used to make geomembranes easily meet the maximum hydraulic conductivity requirement of 1×10^{-10} cm/s (1×10^{-12} m/s), as discussed below.

The following section first describes water vapor transmission tests (Section 4.9.2). The water vapor transmission test results are then used to calculate equivalent hydraulic conductivities of geomembranes (Section 4.9.3).

4.9.2 Water Vapor Transmission Tests

The rate of water permeation through geomembranes is typically evaluated using water vapor transmission tests.

Water vapor transmission tests have been used extensively on various types of membranes and the test procedures have been standardized (e.g., ASTM E96). In brief, the test is performed as follows: the two sides of a geomembrane specimen are subjected to two different relative humidities. Typically, one side is subjected to a 50% relative humidity while the other side is maintained at 0% relative humidity (using a desiccant) or 100% relative humidity (by having a very small head of water (at nearly zero pressure) in contact with the entire surface of the geomembrane

specimen. The relative humidity difference corresponds to a vapor pressure difference which drives vapor through the geomembrane.

The water vapor transmission rate (WVT) measured in the test is the mass of liquid permeating the geomembrane per unit area of geomembrane per unit period of time and is often reported in $g/m^2/day$. The water vapor transmission rate (WVT) depends on the vapor pressure used in the test. It also depends on the thickness of the geomembrane and therefore characterizes a given geomembrane (e.g., a 60 mil (1.5 mm) thick HDPE geomembrane).

Results from water vapor transmission tests are given in Tables 8 and 9 of this section.

4.9.3 Equivalent Hydraulic Conductivity

An equivalent hydraulic conductivity of a geomembrane can be derived from the water vapor transmission rate using the following equation established by Giroud [1984]:

$$k = \frac{g\ T\ (WVT)}{\Delta p} \qquad \text{(Equation 3)}$$

where: k = geomembrane equivalent hydraulic conductivity; g = acceleration of gravity; T = geomembrane thickness; WVT = water vapor transmission rate; and Δp = vapor pressure difference used in the test.

Equivalent hydraulic conductivities derived from water vapor transmission rates using the above equation are given in Tables 8 and 9. It appears that HDPE geomembranes have equivalent hydraulic conductivities of about 1×10^{-15} cm/s (1×10^{-17} m/s). Therefore, the requirement for a

hydraulic conductivity less than 1×10^{-10} cm/s (1×10^{-12} m/s) is met with a margin of about five orders of magnitude. It also appears that the equivalent hydraulic conductivity of HDPE geomembranes is smaller than that of any other available geomembrane.

4.9.4 Conclusion

The literature survey summarized in Tables 8 and 9 has shown that the HDPE geomembrane material selected for the top and bottom liners meets the permeability requirement of COMAR 26.04.07.07.C(12)(a)(ii) with a margin of more than five orders of magnitude. It also appears that of commercially available geomembrane materials, HDPE has the lowest hydraulic conductivity.

4.10 Liner System Resistance to Chemical Attack

4.10.1 Introduction

The liner system components proposed for Cells 8 and 9 of the MLF include:

- the HDPE geomembrane liners;
- the HDPE geonet drainage layers;
- the leachate collection and leachate detection pipes;
- the geotextile filter between the cover soil and the geonet leachate collection layer; and
- the materials used as the protective soil cover, subgrade soil, and pipe bedding aggregate.

This section presents a discussion on the resistance of the HDPE liner system components (i.e.: geomembranes and geonets) to chemical attack by municipal solid waste leachate. A discussion of the resistance of geotextiles and pipes to chemical attack is presented in Section 4.11.2. As part of the Phase III Permit Modification Application, final selection of all liner materials will be made, and the basis for the selection presented.

4.10.2 Background

HDPE is the most chemically inert material used to manufacture geomembranes and geonets for waste management applications [Haxo, et al., 1982; Schwope, et al., 1985]. The resistance of HDPE to many different chemical environments is well known. The inertness of HDPE is attributable to its molecular structure and morphology.

HDPE has a simple molecular structure, containing a six-member repeat unit consisting of two carbon and four hydrogen atoms. The hydrogen atoms are covalently bonded to the carbon atoms. Each carbon-hydrogen bond is equivalent and has the same bond energy. Most degradative reactions in hydrocarbons occur through displacement of a hydrogen atom. However, due to covalent bonding, hydrogen atoms on the HDPE repeat unit are stable; thus, HDPE is not significantly reactive under normal conditions.

HDPE, by virtue of its simple molecular structure, is a relatively linear polymer compared to other polymers such as polypropylene and polyester. This linearity enables close fitting between polymer chains and an orderly lattice structure that produces a relatively dense, semi-crystalline solid. The crystalline regions of the polymer have extremely low permeabilities, thereby minimizing penetration of chemicals into the material.

With HDPE geomembranes and geonets, carbon black is added to the polymer at percentages of about 2 to 3 percent to provide resistance to attack by ultra-violet (UV) light. Antioxidants are added at percentages of less than 0.5 percent to reduce the potential for HDPE oxidation. The antioxidants are physically bound into the polymer by their long chain molecular side groups, thereby precluding their migration out of the polymer matrix. HDPE geomembranes and geonets do not contain plasticizers, thus migration of plasticizers out of the polymer is not a factor.

4.10.3 Resistance To Long-Term Degradation

Testing sponsored by the United States Environmental Protection Agency (USEPA) has shown that among all commercially available synthetic waste management products, HDPE has the highest resistance to attack by almost all chemicals potentially encountered in municipal or hazardous solid waste landfills [Haxo, et al., 1982; Schwope et al., 1985]. There are only two degradative processes which may affect the performance of HDPE geomembranes and geonets in the long term. These are plasticization and oxidation.

Plasticization occurs when a polymer is exposed to a significant concentration of solvent which penetrates the surface of the polymer in large enough quantities to partially dissolve it. As a result, the polymer's strength and resistance to stress cracking are reduced. For HDPE geomembranes and geonets, this is rarely observed to a significant extent, since the vast majority of landfill leachates contain negligible concentrations of such solvents.

Oxidation is a process by which thermal excitation, UV excitation, or oxy acid chain scission (breaking) causes the breakage of carbon-hydrogen bonds. These broken bonds represent highly reactive radicals that readily combine with oxygen. Oxidized HDPE exhibits inferior mechanical properties compared to unoxodized HDPE. An environment conducive to oxidation of HDPE requires both a means to break the carbon-hydrogen bond (i.e., high temperature, sunlight, or high concentrations of metal ions or oxy acids) and a continuous supply of oxygen.

Current research indicates that temperatures in excess of 572°F (300°C) are required to cause significant oxidation of stabilized HDPE geomembranes or geonets. Under prolonged exposure, HDPE may oxidize at a very slow rate at temperatures as low as 212°F (100°C). Municipal solid waste (MSW) landfills develop elevated temperatures but not of this magnitude. Thus, oxidation of HDPE geomembranes or geonets due to temperatures occurring in MSW landfills is unlikely.

Ultra-violet light (UV) induced oxidation will not be a problem at the Millersville landfill because the geomembranes and geonets will not be exposed to sunlight for extended periods after they are installed. High concentrations of metal ions or oxy acids may also catalyze the oxidative process at elevated temperatures. However, the concentrations of these constituents in MSW leachates are usually very low and do not create a significant potential for oxidation of HDPE geomembranes or geonets, particularly those stabilized with antioxidant packages (all four major U.S. manufacturers use stabilizing packages).

On the basis of the foregoing, degradation of the geomembranes or geonets in the liner system of the MLF should not occur.

4.10.4 Laboratory Compatibility Testing of HDPE Geomembranes and Geonets

The approach to establishing the resistance of HDPE geonets to chemical attack by MSW landfill leachate is to carry out chemical compatibility testing. Chemical compatibility tests were carried out by Gundle Lining Systems, Inc. (Gundle) on several of its HDPE geomembrane and geonet products. [Gundle, 1985; Gundle, 1986a; Gundle, 1986b; Gundle 1986c]. Appropriate data is presented in Appendix H and the results of these tests are summarized below.

Laboratory reports #690A, 690B, and 690C indicate no significant physical property changes in Gundle's G-2 HDPE geonet during 90 days of immersion in a laboratory- prepared leachate. The leachate was maintained at a constant temperature of 73°F (23°C) throughout the duration of testing. Unfortunately, no data is available on the composition of the leachate.

Laboratory reports #690B, 690C, 690D, and 690E indicate no significant physical property changes in Gundle's 60 mil (1.5 mm) HDPE geomembrane during 90 days of immersion at 73°F (23°C) in a leachate predominantly composed of low concentrations of organic and metallic constituents. Laboratory report #1327, and 1327C indicate no significant changes in the same HDPE geomembrane after 120 days of immersion in a typical landfill leachate at 122°F (50°C). Again, no data is available on the composition of the leachate.

Laboratory reports 1370, 1370C, 1525, 1525A, and 1525B present the results of compatibility testing of Gundle's HDPE geomembrane immersed in two other MSW leachates for 120 days at both 73°F (23°C) and 122°F (50°C). The reports indicate no significant changes in the physical properties of the HDPE geomembrane.

4.10.5 Conclusions

Available chemical compatibility test data involving MSW leachates and HDPE geomembranes and geonets indicate no significant changes in material properties due to exposure. The HDPE geomembranes and geonets specified for MLF should not be adversely affected by exposure to landfill leachate.

4.11 Properties of Leachate Collection and Leakage Detection System Materials

4.11.1 Introduction

COMAR Section 26.04.07.07.C(12)(c)(i) specifies that the leachate collection and removal system shall be constructed of "materials that are chemically resistant to the waste managed in the landfill and the leachate expected to be generated, and of sufficient strength and thickness to prevent collapse under the pressures exerted by the overlying wastes, waste cover materials, and by any equipment used at the landfill". Components of the MLF leachate collection system and leachate detection system are geotextiles, geonets, leachate collection and leakage detection pipes, and pipe bedding aggregate. This section addresses the resistance to chemical attack and physical and mechanical properties of the geotextiles, geonets, and pipes. The pipe bedding aggregate will be selected to function over the design life of the landfill without failure. The properties of the pipe bedding aggregate will be addressed in the Phase III Permit Modification Application.

4.11.2 Chemical Resistance

Geotextiles. The geotextiles considered for MLF will be made of either polypropylene or polyester. These polymers have good resistance

to attack by a wide range of chemicals. For this reason, these materials have been extensively used in leachate collection and leachate detection systems of hazardous waste and municipal solid waste (MSW) landfills. Inorganic constituents present in the MSW leachate will have no significant effect on either polyester or polypropylene. Organic constituents, on the other hand, can affect polyester and polypropylene if they are present in concentrations of 10 percent or more [Schwope et al., 1985]. The concentrations of the organic constituents detected in MSW leachate are typically very low. As a result of the very low concentrations of organic constituents, it is unlikely that the leachate will have a detectable effect on either polypropylene or polyester, even after a long period of exposure. Therefore, it can be concluded that polypropylene and polyester geotextiles have adequate resistance to chemical attack by leachate from MLF.

Geonets. The geonets specified for the MLF are manufactured from high density polyethylene (HDPE). This same polymer is used to manufacture the geomembranes specified for the MLF top and bottom liners. The ability of HDPE to resist chemical attack by MSW leachate was discussed in Section 4.10. HDPE was shown to have good resistance to attack from a wide range of chemicals. It may be concluded, therefore, that HDPE geonets should have adequate chemical resistance to attack by leachate from the MLF.

Pipes. The pipes to be used in the leachate collection system and leakage detection system of MLF will be made of either HDPE or unplasticized polyvinyl chloride (UPVC). As discussed in Section 4.10, HDPE has good resistance to attack from a wide range of chemicals. It may be concluded that HDPE pipes should have adequate chemical resistance to attack by MLF leachate.

UPVC pipes do not have any plasticizers which may leach out of the material in the presence of heat and/or certain chemicals. Organic

constituents may affect UPVC if they are present in high concentrations (10 percent or more) [Schwope et al., 1985]. As mentioned previously, concentrations of organic constituents in MSW leachates are typically very low. Therefore, it is unlikely that the organic constituents MLF leachate will have a detectable effect on UPVC even after a long period of exposure. It can be concluded that UPVC pipes are anticipated to have adequate resistance to chemical attack by MLF leachate.

4.11.3 Physical and Mechanical Properties

Geotextiles. The mechanical properties of the geotextiles will be selected based upon survivability (the ability to withstand stresses exerted by construction equipment during installation) and durability (the ability to withstand stresses applied during the landfill design life and post-closure care period) considerations. These mechanical properties, including grab strength, puncture strength, and tear strength, will be obtained from the Federal Highway Administration Geotextile Engineering Manual [Christopher and Holtz, 1984]. If the material specifications are adhered to, and proper construction quality assurance monitoring is implemented, the geotextiles should function properly throughout the active life and post-closure care period of the landfill.

Geonets. For landfill drainage applications, thick and relatively incompressible geonets are required to provide adequate flow capacity. These requirements will be considered in selecting the geonet physical properties.

The most important mechanical property to consider when geonets are used in drainage applications is compressibility. A geonet must be relatively incompressible so that its channels remain open under the high compressive stresses resulting from the weight of the overlying wastes waste cover materials, and equipment. A decrease in geonet thickness

results in decreased flow capacity. To account for compressive stress, the geonet hydraulic transmissivity will be established at a compressive stress equal to 1.5 times the maximum compressive stress the geonet will be subjected to in the field. This should ensure that geonets used at the MLF have adequate mechanical properties to function as drainage layers during the design life of the facility.

The tensile strength of geonets is usually not an important mechanical property in landfill design. Geonets must have sufficient tensile strength to remain stable on slopes during construction. Because geonet tensile strengths are relatively low, they are usually assumed to be zero in the portion of the design related to the stability of the lining system of the landfill side slopes. The tensile strengths of geonets have been measured in the laboratory using constant-rate-of-strain tensile tests at strain rates on the order of 2 percent per minute and at temperatures in the range of 68°F (20°C). Under these conditions, geonet tensile strengths range from 12 lb/in. (2 kN/m) to 72 lb/in. (12 kN/m). The geonet machine-direction strength is usually 50 to 100 percent larger than the cross-machine direction strength. Geonets can undergo large elongations without breaking. In the tensile tests described above, elongations at break were in the range of 40 to 100 percent. Geonet stress-strain curves from tensile tests exhibit a shape characteristic of ductile materials (i.e., the peak strength is equal to the ultimate strength and there is no strain softening). The ductile stress-strain behavior of geonets is advantageous from a design standpoint, as it allows the geonet to undergo large deformations without breaking.

Pipes: The pipes at MLF will be designed to be structurally stable under the maximum anticipated stress. Structural stability is typically evaluated by comparing three types of maximum anticipated pipe deformations to allowable pipe deformation. The three types of deformation are: (i) ring deflection; (ii) ring compression (wall

crushing); and (iii) longitudinal (beam) flexure. Each of these types of deformation will be considered in the detailed design carried out for the Phase III Permit Modification Application.

4.11.4 Conclusions

The geotextile filter layers, geonet drainage layers and pipes for MLF will be selected based on their resistance to chemical attack by MSW leachate, and their physical and mechanical properties. These properties have been described in this section. The considerations presented in this section indicate that the properties of the geotextiles, geonets, and pipes are adequate to perform their required functions at the Millersville landfill.

4.12 Resistance of Drainage Layers to Clogging

This section presents a discussion of the ability of leachate collection systems and leachate detection systems constructed with geonet drainage layers to function without clogging. Clogging is defined as the physical build-up of material in any of the components of the leachate collection system or leachate detection system to the extent that leachate flow is significantly restricted. Clogging can be caused by physical, chemical, biochemical, and biological mechanisms [Bass, et al., 1984 and Bass, 1985]. Each of these mechanisms is addressed below.

4.12.1 Physical Mechanisms of Clogging

The most common form of clogging within any landfill drainage system is physical clogging. Physical mechanisms that may lead to clogging of leachate drainage layers include inadequate flow capacity, structural failure, and sedimentation [Bass, 1985]. Inadequate capacity and structural failure specifically related to the leachate collection pipe

system is not discussed here. Sedimentation is the build-up of solid materials in a pipe, geonet drainage layer, or geotextile filter layer. Clogging by sedimentation requires both a source of solids and a mechanism by which the solids can settle out. Such a mechanism occurs at transition zones within the drainage system. A critical transition zone occurs within leachate collection systems at the junctions of the cover soil, geotextile filter layer, and geonet drainage layer.

The role of the geotextile filter is to prevent migration of cover soil particles into the geonet drainage layer. When properly designed, the geotextile filter should protect the geonet drainage layer from the build-up of potentially clogging sediment. The geotextile filter between the cover soil and the drainage layer must perform several functions: (i) the geotextile must retain the particles of soil (which implies that the size of its openings cannot exceed a maximum value); (ii) the geotextile must be permeable enough to allow free flow of leachate into the drainage layer (which implies that the size of its openings must be larger than a minimum value); and (iii) the geotextile must not clog during the design life of the facility (which implies that the porosity of the geotextile must be larger than a minimum value, i.e., it must have a large number of openings). Retention, permeability, and clogging criteria for geotextile filters have been presented in the Federal Highway Administration Geotextile Engineering Manual [Christopher and Holtz, 1984] and by Giroud [1982].

A geotextile filter layer must also be designed to withstand the stresses induced by cover soil placement such that the geotextile will not tear or puncture. Breaches in the geotextile will allow potentially clogging sediment to enter into the geonet drainage layer. Therefore, the geotextile must exhibit adequate survivability properties. The mechanical properties to be specified for survivability include grab strength, puncture strength, and tear strength.

4.12.2 Chemical Mechanisms of Clogging

Chemical mechanisms for clogging involve the formation of insoluble precipitates due to chemical reactions. Chemical reactions include precipitation of calcium carbonate, manganese carbonate, and other insoluble forms (such as sulfides and silicates). Studies sponsored by the U.S. Environmental Protection Agency (USEPA) concluded that even though chemical precipitates can form in landfill drainage systems, clogging of the systems as a result of chemical precipitation is unlikely [Bass et al., 1984; Bass, 1985]. Therefore, chemical clogging of the leachate collection system or leachate detection system of the Millersville landfill is not expected.

4.12.3 Biochemical Mechanisms of Clogging

Biochemical mechanisms that may lead to clogging involve the build-up of chemical and/or biological precipitates due to biological activity in a drainage system. Studies sponsored by USEPA indicate that no cases of biochemical clogging have ever been reported for the conventional leachate drainage systems of the municipal waste landfills investigated [Bass, 1985]. Therefore, biochemical clogging of the leachate collection system or leachate detection system of the Millersville landfill is not expected.

4.12.4 Biological Mechanisms of Clogging

Biological clogging occurs when organism growth fills the pipe or interstices of the drainage or filter layers and interferes with normal system flow. Little is know about biological clogging of drainage systems constructed with either geonet drainage layers or granular drainage layers. Intuitively, the concern may be larger for drainage systems

constructed with geonets due to their lack of thickness. On the other hand, the relatively large porosity, hydraulic conductivity, and leachate flow velocities in geonets may be perceived as advantages for the following reasons:

- geonet drainage materials have virtually zero capillary tension and hence, a low fluid storage capacity which will help curtail biological growth;

- the relatively high flow velocities in geonets should help keep geonet drainage systems flushed; and

- the large flow channels reduce the probability of flow channel blockage.

In addition, the leachate and leakage collection pipes will be constructed with cleanouts that will enable periodic pipe flushing. Flushing should virtually eliminate the potential for biological growth and associated clogging of the pipes. On the basis of the foregoing information, biological clogging of the leachate collection system or leakage detection system of MLF is not a concern.

N890677

Table 8 *Results of Water Vapor Transmission Tests on Geomembranes.* The water vapor transmission (WVT) rates are from Haxo et al. [1984]. From these WVT values, the values of the equivalent hydraulic conductivity (k) were derived using Equation 3. All these tests were conducted at 23°C with a relative humidity difference of 50%, which is equivalent to a vapor pressure difference, Δp, of 1.4 kPa. Definitions of polymer symbols can be found in [Giroud and Frobel, 1983].

Polymer	Geomembrane Thickness T (mm)	Water Vapor Transmission WVT ($g/m^2/day$)	Equivalent Hydraulic Conductivity k (m/s)
Butyl rubber	0.85	0.384	2.7×10^{-14}
	0.85	0.020	1.4×10^{-15}
	1.85	0.097	1.5×10^{-14}
CPE	0.53	0.643	2.8×10^{-14}
	0.79	1.400	9.0×10^{-14}
	0.79	0.320	2.1×10^{-14}
	0.85	0.264	1.8×10^{-14}
	0.94	0.305	2.3×10^{-14}
	0.97	0.643	5.1×10^{-14}
CSPE	0.74	0.333	2.0×10^{-14}
	0.76	0.663	4.1×10^{-14}
	0.89	0.438	3.2×10^{-14}
	0.91	0.748	5.5×10^{-14}
	0.94	0.422	3.2×10^{-14}
	1.07	0.252	2.2×10^{-14}

Table 8 Continued

Polymer	Geomembrane Thickness T (mm)	Water Vapor Transmission WVT ($g/m^2/day$)	Equivalent Hydraulic Conductivity k (m/s)
Elasticized Polyolefin	0.72	0.142	8.3×10^{-15}
CO	1.160	20.18	1.9×10^{-12}
	1.650	14.30	1.9×10^{-12}
EPDM	0.51	0.270	1.1×10^{-14}
	0.94	0.190	1.5×10^{-14}
	1.70	0.172	2.4×10^{-14}
Neoprene	0.51	0.304	1.3×10^{-14}
	0.91	0.473	3.5×10^{-14}
	1.27	0.429	4.4×10^{-14}
	1.59	0.237	3.1×10^{-14}
Nitrile rubber	0.76	5.51	3.4×10^{-13}
Polybutylene	0.69	0.084	4.7×10^{-15}

Table 8 Continued

Polymer k	Geomembrane Thickness T (mm)	Water Vapor Transmission WVT ($g/m^2/day$)	Equivalent Hydraulic Conductivity k (m/s)
Polyester Elastomer	0.20	10.50	1.7×10^{-13}
LDPE	0.76	0.0573	3.5×10^{-15}
HDPE	0.80	0.0172	1.1×10^{-15}
	2.44	0.0062	1.2×10^{-15}
HDPE-Alloy	0.86	0.0472	3.3×10^{-15}
PVC	0.28	4.42	1.0×10^{-13}
	0.51	2.97	1.2×10^{-13}
	0.76	1.94	1.2×10^{-13}
	0.79	1.85	1.2×10^{-13}
PVC-E	0.91	2.78	2.1×10^{-13}
PVC-OR	0.83	4.17	2.8×10^{-13}

Table 9 *Results of Water Vapor Transmission Tests on Polymers.* The water vapor transmission (WVT) rates are from Rogers [1964]. From these WVT values, the values of the equivalent hydraulic conductivity (k) were derived using Equation 3.

Polymer Type	Vapor Pressure Difference	Water Vapor Transmission	Geomembrane Thickness	Equivalent Hydraulic Conductivity
	Δp	WVT	T	k
	(kPa)	($g/m^2/day$)	(mm)	(m/s)
CSPE	6.4	161	0.025	7.2×10^{-14}
Butyl	6.4	26	0.025	1.2×10^{-14}
PVC	6.1	32	0.025	1.5×10^{-14}
HDPE 0.92	6.4	28	0.025	1.2×10^{-14}
0.94	5.8	14	0.025	6.9×10^{-15}
0.95	6.1	6.7	0.025	3.1×10^{-15}
0.96	5.8	4	0.025	2.0×10^{-15}

Note: Values ranging from 0.92 to 0.96 are HDPE specific gravities.

System	Series	Group	Formation		Average thickness (feet)	Lithologic symbol	Hydrologic character	General lithology
QUATERNARY	HOLOCENE and PLEISTOCENE		Alluvium and terrace deposits		30		Confining bed in most places. Poor aquifer in some places.	Sand, gravel, silt, and clay.
TERTIARY	EOCENE	PAMUNKEY	Nanjemoy Formation		80		Confining bed	Sand, with clayey layers, glauconitic.
			Marlboro Clay		30		Confining bed	Clay, plastic, pale-red to silvery gray.
	PALEOCENE		Aquia Formation		100		Aquifer	Glauconitic, greenish to brown sand with indurated or "rock" layers in middle and basal parts.
			Brightseat Formation		40		Confining bed in most places. Poor aquifer in some places.	Sand, silt, and clay, olive gray to black, glauconitic.
	UPPER		Severn Formation		90		Poor aquifer in places.	Sand, silty to fine, with some glauconite.
			Matawan Formation		30		Confining bed	Silt and fine sand, clayey, dark gray to black, glauconitic.
CRETACEOUS	CRETACEOUS		Magothy Formation		100		Aquifer	Sand, light gray to white, with interbedded thin layers of organic black clay.
	LOWER CRETACEOUS	POTOMAC	Patapsco Formation	Upper part	250		Confining bed	Clay, tough, variegated color.
							Aquifer	Sand, fine to medium, brown color.
				Lower part	250		Confining bed	Clay, tough, variegated color.
							Aquifer	Sand, fine to medium, brown color.
			Arundel Clay		250 (?)		Confining bed	Clay, red, brown, and gray, contains some ironstone nodules and plant remains.
			Patuxent Formation		250 (?)	? ?	Aquifer 1 Confining bed Aquifer 1	Sand, gray and yellow, with interbedded clay; kaolinized feldspar and lignite common. Locally clay layers predominate.
LOWER PALEOZOIC (?) TO PRECAMBRIAN(?)			Basement Complex 1/		Unknown		Confining bed	Probably gneiss, granite, gabbro, metagabbro, quartz diorite and granitized schist.

1/ Consolidated red shaly rocks of Triassic (?) age were drilled at Sandy Point State Park.

Foundation Settlement

- Settlement of the foundation of the landfill may occur as waste is placed in the landfill due to (1) settlement of the sand from 0' to 30' below the base of the landfill (sand over 30' below the base of the landfill had standard penetration test N-values from 50 to 100+ and, therefore, should exhibit relatively negligible settlement) and (2) due to settlement of the two major clay units beneath the landfill. Settlements of the sand and clay are estimated below for Cell 8.

- Unit weight of waste and cover soils (daily and intermediate) is assumed to be 60pcf.

Subject (if Meeting: Location and Attendees): Foundation Settlement -- Applied Net Load Due to Landfill

Applied Net Load Due to Landfill

- For Cell 8: Triangular Load Distribution
  0 ft of waste @ edges to ≈ 140 ft of waste @ center.
- May be idealized to a uniform load distribution ranging from about 100 ft of waste to 140 ft of waste.
- 1.4 million cubic yards of soil will be excavated from Cell 8, over a 60 acre area.

$$\frac{1{,}400{,}000\ yd^3}{1} \times \frac{27\ ft^3}{yd^3} \times \frac{1}{60\ a \times 43{,}560\ ft^2/a}$$

= 15 feet average excavation

Say 10 ft of soil is removed at the center

- Net Load Applied = (100 to 140 ft) × 60 pcf − 10 × 125 pcf

= (6000 psf to 8400 psf) − 1250 psf

= 4750 psf to 7150 psf

= 2.4 tsf to 3.6 tsf

Lining System Strain Caused By Settlement of the Foundation Soils

- The estimated settlement of the foundation soils in the center of cells 8 and 9 is less than 1 ft. For preliminary calculations, it will conservatively be assumed that the maximum differential settlement between the edge and center of the landfill cells is 1 ft.

- The distance between the points of maximum and minimum settlement is assumed to be 600 ft. (from plan view of cells).

- 
$$X = \sqrt{600^2 + 1^2} = 600.0008 \text{ ft}$$

- $$\text{Strain} = \frac{600.0008 - 600}{600} = 0.0001\%$$

- This value of strain is very small and can be easily tolerated by the lining system.

Subject (if Meeting: Location and Attendees): Stability of Excavation

- Evaluate stability of Cell 8 excavation before waste is placed.

- Idealized soil profile of Cell 8 in vicinity of excavation. Based on the results of boring program (especially borings G7 and G9, which are the in the vicinity of the Cell 8 excavation).

SOIL	DESCRIPTION	EFFECTIVE STRESS FRICTION ANGLE	MOIST UNIT WEIGHT
SOIL 1	LOOSE POORLY GRADED SAND	26° (c'=0) [Lambe and Whitman, 1969]	115 pcf
SOIL 2	STIFF CLAYEY SILT PI determined from laboratory tests performed on samples from borings G7 and G9 = 4.0, 7.3, 6.0. PI avg = 6	26° (c'=0) [Lambe and Whitman, 1969]	120 pcf

- For stability analyses, model as one soil type with $\phi = 26°$ and $\gamma = 120$ pcf. The selected soil friction angle is at the low end of values given for the two soils. Therefore, the friction angle is believed to be conservative.

Subject: Check Lining System Stability

[Giroud and Beech, "Stability of Soil Layers on Geosynthetic Lining Systems", Geosynthetics 1989, San Diego, 1989]

Consider HDPE Geonet / Geomembrane $\phi_i = 11°$ to $15°$
[Williams & Houlihan, 1986]

$$H_{max} = \frac{T_c}{2\cos\beta}\left[1 + \frac{\sin\phi_c \cos\phi_i}{\cos(\beta+\phi_c)\sin(\beta-\phi_i)}\right]$$

$$= \frac{\overset{1.5}{\cancel{2}}\text{ ft}}{2\cos 14}\left[1 + \frac{\sin 26 \cos\phi_i}{\cos 40 \sin(14-\phi_i)}\right]$$

$= \overset{9}{\cancel{12}}$ feet for $\phi_i = 11°$ (i.e.: $(12 \times 4) = \overset{36}{\cancel{48}}$ ft upslope)

= infinite for $\phi_i = 15°$

$= \overset{25}{\cancel{34}}$ feet for $\phi_i = 13°$ (i.e.: $\overset{100}{\cancel{136}}$ ft. up slope

∴ cover soil may be placed in $\overset{35}{\cancel{50}}$ ft to $\overset{100}{\cancel{140}}$ increments up slope ahead of waste placement.

Subject (if Meeting: Location and Attendees): Lining System Stability - After Waste Placement

- Evaluate lining system stability after waste placement for the following preliminary landfill geometry. (This geometry may be revised as part of the final landfill design.)

Scale: 1" = 100'

(waste assumed to be placed across base of subcell)

- Assumed waste properties:

$\phi'_w = 25°$ $c'_w = 0$ (conservative assumption)

$\gamma_w = 60$ pcf

(based on a review of the literature and GeoServices project files, see discussion in text)

- Evaluate stability along the two critical interfaces within the lining system: geomembrane/subbase and geonet/geomembrane.

Lining System Stability -- After Final Cover System is Placed

- Lining system cross section and interface strength properties used for the analysis are as given in Lining System Stability -- Before Waste Placement calculations.

- Consider the following preliminary landfill geometry (may be modified as part of final landfill design)

SCALE: 1" = 200'

- Assumed waste properties:

$\phi'_w = 25°$ $\gamma_w = 60$ pcf

$c'_w = 0$

- Evaluate stability along the two critical interfaces within the lining system: geomembrane/subbase and geonet/geomembrane

Written by: B.A.M. Date: 89/10/16 (YY/MM/DD) Reviewed By: MOE Date: 89/10/24 (YY/MM/DD)

Client: G.B.B. Project: Millersville Landfill Phase II Project/Proposal No.: P1160 Task No.: 7.1

- Evaluate stability using the computer program PCSTABL5 with the simplified Janbu method of slices.

-

Interface	Factor of Safety
HDPE Geomembrane/ Compacted Subbase	1.67
HDPE Geonet / HDPE Geomembrane	1.33

- Critical failure surface:

- Supporting computer output is attached.

and X = 150.00 ft.

Each Surface Terminates Between X = 326.00 ft.
and X = 426.00 ft.

Unless Further Limitations Were Imposed, The Minimum Elevation At Which A Surface Extends Is Y = .00 ft.

25.00 ft. Line Segments Define Each Trial Failure Surface.

Following Are Displayed The Ten Most Critical Of The Trial Failure Surfaces Examined. They Are Ordered - Most Critical First.

* * Safety Factors Are Calculated By The Modified Bishop Method * *

CHEMICAL COMPATIBILITY DATA

LABORATORY REPORT #690

FEBRUARY 26, 1985

CHEMICAL RESISTANCE TESTS WITH SYNTHETIC LEACHATE

TEST METHOD:

Gundnet G-2, Gundfab 014 and Gundflex 300 were prepared for immersion testing in synthetic leachate at 23°C. ASTM D638 tensile type 1½" x 5" dumb-bells and a speed of 2 ipm were used for these tests.

Upon 7-day immersion period, all samples were pressed and immediately tested after removal from the test solution.

The immersion test will be continued up to 90 days with samples being removed after 30, 60 and 90 days.

RESULTS:

Type	Control (Lbs.)	7-Day (Lbs.)	% Change
G-2	39	41	+5.1
G-014	63	99	+57.2
G-Flex-300	109	80	-27

CONCLUSION:

After 7-day immersion, G-2 did not appear to have been affected, G-014 had been increased but G-Flex-300 had been affected by synthetic leachate and decreased to 27 percent.

Lab Technician
Sengthong Phouangsavanh

LABORATORY REPORT #690A

APRIL 1, 1985

CHEMICAL RESISTANCE TESTS WITH SYNTHETIC LEACHATE

TEST METHOD:

Gundnet G-2, Gundfab 014 and Gundflex 300 were prepared for immersion testing in synthetic leachate at 23°C. ASTM D638 tensile type 1½" x 5" dumb-bells and a speed of 2 ipm were used for these tests.

Upon 30-day immersion period, all samples were pressed and immediately tested after removal from the test solution.

The immersion test will be continued up to 90 days with samples being removed after 60 and 90 days.

RESULTS:

Type	Control (Lbs.)	30-Day (Lbs.)	% Change
G-2	39	38	-3
G-014	63	95	+51
G-Flex-300	109	89	-18

USION:

After 30-day immersion, G-2 was not affected. G-014 improved 51% and G-Flex-300 decreased in strength 18 percent.

ab Technician
engthong Phouangsavanh

LABORATORY REPORT #6908

APRIL 12, 1985

CHEMICAL RESISTANCE TESTS WITH ORGANICS/METALS LEACHATE

TEST METHOD:

Gundline HD 60 mil liner was prepared for immersion testing at 23°C. ASTM D638 tensile type IV dumb-bells and a speed of 2 ipm were used for these tests. 1" x 3" strips were used for weight and dimensional change.

Samples were removed, wiped dry, and tested after 7 days. The test will be continued up to 90 days.

TEST RESULTS:

Tensile Strength & Elongation

60 mil HDPE at 23°C

MD	Yield Strength (psi)	Yield Elongation (%)	Break Strength (psi)	Break Elongation (%)
Control	3017	15	4140	800

TD	2.9614	2.9617	+.01

Thickness Change (1" x 3")

MD	.61"	.60"	-1.6
TD	.60"	.60"	Ø

CONCLUSION:

No significant change resulted from immersion in the leachate.

Technician
Sengthong Phouangsavanh

LABORATORY REPORT #6908

APRIL 19, 1985

SUBJECT:

Chemical resistance tests with synthetic leachate

TEST METHOD:

1½" x 5" samples of Fibretex 300 and Gundfab 014 geotextiles and Gundnet G2 geonet were immersed at 23°C in the synthetic leachate.

Tensile tests at a crosshead speed of 2 ipm as per ASTM D638 were performed on the samples after 60 days. The test will be continued for 90 days.

TEST RESULTS:

Type	Tensile Break		
	Control (lbs.)	60 Days (lbs.)	% Change
G-2	39	42.5	+9
G-104	63	85	+35
G-Ftex-300	109	130	+19.3

CONCLUSION:

No degradation of the samples occurred. In fact, the textiles showed significant increase in tensile strength.

Lab Technician
Sengthong Phouangsavanh

LABORATORY REPORT #690C

MAY 20, 1985

SUBJECT:

Chemical resistance tests were performed in synthetic leachate containing metals and metal salts.

TEST METHOD:

1½" x 5" samples of Fibretex 300 and Gundfab 014 geotextiles and Gundnet G2 geonet were immersed at 23°C in the synthetic leachate.

Tensile tests at a crosshead speed of 2 ipm as per ASTM D638 were performed on the samples after 90 days of immersion. 90 days concludes this test.

TEST RESULTS:

TENSILE BREAK

(After 90 Days Immersion)

Type	Control (lbs.)	90 Day (lbs.)	% Change
G-2	39	49	+26
G-014	63	98	+55.5
G-FTex-300	109	98	-10.1

CONCLUSION:

No sample degradation occurred. Significant differences from the control took place, but the break strength did not show any significant decrease and, in fact, increased in two cases.

CHEMICAL IMMERSION OF GUNDLINE HD

WITH A MUNICIPAL LANDFILL LEACHATE

SUBJECT:

Results of chemical compatibility (EPA Method 9090) testing of Gundline HD with a municipal landfill leachate from Cortland Co. landfill after 90 days immersion.

TEST METHOD:

Die-cut ASTM test specimens were placed in the leachate and kept at temperatures of both 23°c and 50°c. Samples were removed after the 90 day period and subjected to the following tests:

Test	Method
Tensile Properties	ASTM D638
Tear Initiation Resistance	ASTM D1004C
Puncture Resistance	FTMS 101B
Weight Change	
Thickness Change	

TEST RESULTS: (After 90 days immersion).

CONCLUSION/DISCUSSION:

No significant change in the Gundline HD took place after 120 days immersion. The Small amount of ~~absorbed~~ absorption by the liner stabilized quickly as indicated by the 30, 60, 90 and 120 day weight gain being constant. All properties remained well within Gundle specifications.
